

### About the Book:

The PG and Research Department of Mathematics, Saiva Bhanu Kshatriya College, Aruppukottai has organized a National Seminar on Current Perspectives in Mathematics on 01.04.2023, to focus on the recent innovative developments in the field of Mathematics. The Proceedings of the Seminar is duly edited and to be brought out by Dr. N. Kandaraaj, Associate Professor and Head PG and Research Department of Mathematics and by Dr. V. Thiruveni, Assistant Professor of the same department. This edited book volume contains 19 articles belonging to various fields in Mathematics.

## About the Seminar

The National Seminar on Current Perspectives in Mathematics was conducted by the PG and Research Department of Mathematics on 01.04.2023 in the New Conference Hall, Saiva Bhanu Kshatriya College, Aruppukottai. 163 participants, including students, research scholars and faculty members, attended the Seminar. The theme of the seminar was to motivate the students, researchers and young faculty to develop interest towards higher education and research in Mathematics. Dr. M. Chandramouleeswaran, Head (Retired), PG and Research Department of Mathematics, S.B.K. College delivered the Keynote address, which motivated the participants towards the technical sessions.

In the technical session I, Dr. R. Kala, Professor, M. S. University, Tirunelveli delivered a lecture on the topic “*Some new graph Parameters*”. The participants got the idea about the developing concepts in the field of graph theory. They enjoyed the session and interacted with the resource person. In the technical session II, Dr. S. Rajeshwari, Assistant Professor, BIT, Bangalore delivered a lecture on the topic “*Complex Analysis and Value Distribution Theory*”. The talk was well organized and it gave the participants, clear information about the Value Distribution Theory. In the technical session III, Dr. M. Chandramouleeswaran recalled the definitions of semigroups and semirings and explained how a semiring valued semigraph was constructed, in his talk on “*Semiring Valued Semi-graphs*”. On the whole, all three sessions gave a platform for the participants to interact with reputed Resource Persons.

The paper presentation was conducted in 4 parallel sessions. 29 participants presented their papers in the seminar. From them, 19 papers were shortlisted by the Editors for publication in the Proceedings.

## About the College

Saiva Bhanu Kshatriya College, Aruppukottai, Tamil Nadu, India was established by Aruppukottai Nadar Uravinmurai Pothu Abiviruthi Trust in 1970. The college is an aided co-educational institution affiliated to Madurai Kamaraj University, Madurai. The college offers UG and PG Courses in various disciplines. Two departments are upgraded as Research Centre. The vision of the college is to impart quality higher education to the socio-economically weaker student community. The aim of the college is “Aim High” reflecting the pursuit of excellence. The college also provides value-based education and train the students to become worthy citizens.

## About the Department

The department of Mathematics was established in the year 1970 with the Pre University Course. B.Sc. (Mathematics) and M.Sc. (Mathematics) were introduced in 1982 and 1987 respectively. In the year 2013, it became a research centre. Active research is being carried on by the faculty of the department in both pure and applied mathematics. The department is conducting National Seminar every year with funds from various funding agencies and also as self-funded. Through the department, 26 research scholars were awarded Ph.D. degree. The staff members of the department published more than 150 research papers in reputed, peer-reviewed National and International journals and presented many research papers in National and International Conferences.

## Organizing committee

### **Patrons**

**Thiru. C.J. Gnana Gowthama Pandiyan,**

President, S.B.K. College, Aruppukottai.

**Thiru. R. Gunasekaran,**

Secretary, S.B.K. College, Aruppukottai.

**Thiru. G. Rathinasamy,**

Vice President, S.B.K. College, Aruppukottai.

**Thiru. M. Pragadish Prabu,**

Assistant Secretary, S.B.K. College, Aruppukottai.

**Thiru. R. Sundarajan,**

Treasurer, S.B.K. College, Aruppukottai.

**Thiru. N.R. Ramesh,**

Member, S.B.K. College, Aruppukottai.

### **Chairman**

**Dr. K. Sudhakaran,** M.Com., M.Phil., Ph.D.,

Principal (i/c), S.B.K. College, Aruppukottai..

### **Convener**

**Dr. N. Kandaraj,** Head & Associate Professor,

### **Organizing Secretary**

**Dr. V. Thiruveni,** Assistant Professor

### **Organizing Committee Members**

**Dr. M. Rajkumar,** Associate Professor

**Dr. K.P.V. Preethi,** Assistant Professor

**Dr. S. Raja Dharik,** Assistant Professor

**Mr. M. Kasi Mayan,** Assistant Professor

**Dr. K. Sujatha,** Assistant Professor

**Mrs. S. Kavitha,** Assistant Professor

**Mrs. P. Suseela,** Assistant Professor

**Mrs. P. Jainumbu Beevi,** Assistant Professor

## **Message from the Principal**

**Dr. K. Sudhakaran,**

**Principal (i/c)**

**Saiva Bhanu Kshatriya College,**

**Aruppukottai - 626101.**

Greetings to all the participants and faculty members of the PG and Research Department of Mathematics. The PG and Research Department of Mathematics, Saiva Bhanu Kshatriya College is functioning since the academic year 1971-1972 with teaching Mathematics for Pre-University Course. In the year 1982-1983 B.Sc., Mathematics course was introduced. The Department started offering M.Sc. Programme in Mathematics in the year 1987-1988. It also offers M.Phil., programme in Mathematics as a self-supporting programme since 2007-2008. It has been upgraded into a full-pledged research center from the academic year 2013-2014. Active research is being carried on by the faculty of the department in both pure and applied mathematics. The department is conducting National Seminar every year with funds from various funding agencies and also as self-funded. This year, they have conducted the National Seminar on Current Perspectives in Mathematics. The Proceedings of the Seminar is duly edited and brought out by Dr. N. Kandaraj, Associate Professor and Head of the Department and Dr. V. Thiruvani, Assistant Professor, PG and Research Department of Mathematics of our college as the Convener and Organizing Secretary of the Seminar. My best wishes to the faculty members of the department and the participants.

## **From the Desk of Editors**

The PG and Research Department of Mathematics, Saiva Bhanu Kshatriya College, Aruppukottai has been organizing National Seminar every year to focus on the recent innovative developments on various fields of Mathematics. It paved a way for the research scholars and young college teachers to exchange information in different branches of Mathematics with the experts in the field. This year the National Seminar on Current Perspectives in Mathematics is organized on 01.04.2023. The seminar was inaugurated by Dr. M. Chandramouleeswaran, Retired Head of our Department under the president ship of Mr. R. Gunasekaran, Secretary, Saiva Bhanu Kshatriya College Managing Board, in the presence of Dr. K. Sudhagan, Principal(i/c). Many distinguished mathematicians from various universities and colleges actively participated in the seminar. There were three invited speakers and 29 contributory papers. The topics discussed during the seminar include Graph Parameters, Complex Analysis and S-Valued Semi-graphs. This proceeding contains 19 selected papers presented by the participants at the seminar. We take this opportunity to thank the Managing Board of Saiva Bhanu Kshatriya College for their constant encouragement to organize the seminar and edit the proceedings. We extend our thanks to Dr. K. Sudhagan, Principal (i/c), Saiva Bhanu Kshatriya College, Aruppukottai for his support and encouragement. Our special thanks to the staff members, research scholars and students of the Department for their enthusiastic and unstinted support rendered for the successful conduct of the Seminar. We thank all the participants but for whom the seminar would not have been such a success. Finally, we thank the Editor, Research Culture Society and Publication for his help in bringing this proceeding.

**Dr. N. Kandaraj and Dr. V. Thiruveni**

**ABSTRACT:** *The theory of domination in graphs has been studied by several authors. In 2015, Chandramouleeswaran and others introduced semiring valued graphs (that is graphs whose vertices and edges are labeled with values from a semiring  $S$ ) and they have done several works on weight dominating vertex sets and weight domination number for  $S$ -valued graphs. Motivated by these previous investigations, we work here on the partial weight domination number of  $S$ -valued graphs. We get interest in studying the relationship between the partial weight domination and the weight domination parameters. Some bounds on  $(\alpha, p)$  partial weight domination number of  $G^S$ , that is  $\gamma_{(\alpha,p)}(G^S)$  are obtained for  $G^S$  and we derive some results for the partial weight dominating vertex sets of a  $S$ -valued graphs. Also we establish a relationship between two partial weight domination numbers of  $S$ -valued graph  $\gamma_{(\alpha,p)}(G^S)$  and  $\gamma_{(\alpha,q)}(G^S)$  where  $0 \leq p < q \leq 1$ , which in turn provides another upper bound for  $\gamma_{(\alpha,p)}(G^S)$ . Further, we focus special attention on  $(\alpha, 1/2)$  domination number of  $S$ -valued graphs.*

## 1. INTRODUCTION:

More than 4000 papers were published on dominating sets in graphs and in all that papers, properties of variety of variations of dominating sets and good bounds for various domination numbers were derived. Many variations of the dominating sets can be found in graphs, most of which are motivated by many real life situations.

We consider one such real life situation in the following street lights problem. There are  $n$  street lights in the street and each light is focusing on particular length of the street. Each vertex represents the street lights and  $u$  and  $v$  are adjacent if and only if the two lights focus each other. In this case the most economical solution is the minimum number of possible lights that cover the streets, correspond to the  $\gamma$ -sets. Suppose that due to the repair of lights or the short circuit, we can at most secure a fraction or part of the street lights and keep switched off the lights that are needed to be repaired on that particular day. In that case, we need partial weight domination in  $S$ -valued graphs and the length is nothing but the weight of the graph. In this present work, we define partial domination parameter in  $S$ -valued graphs and derive some results for the  $\gamma_{(\alpha,p)}$ -sets, that is the partial weight domination sets of  $S$ -valued graphs and partial weight domination number of certain  $S$ -valued graphs.

## 2. PRELIMINARIES

**Definition 2.1.** [4] A Semiring  $(S, +, \cdot)$  is an algebraic system with a non-empty set  $S$  together with  $+$  and  $\cdot$  such that

1.  $(S, +, 0)$  is a monoid.
2.  $(S, \cdot)$  is a semigroup.
3. For all  $a, b, c \in S$ ,  $a \cdot (b+c) = a \cdot b + a \cdot c$  and  $(a+b) \cdot c = a \cdot c + b \cdot c$
4.  $0 \cdot x = x \cdot 0 = 0 \forall x \in S$

**Definition 2.2.** [3] Let  $(S, +, \cdot)$  be a semiring. A relation  $\preceq$  is said to be a canonical pre-order if for  $a, b \in S$ ,  $a \preceq b$  if and only if there exists  $c \in S$  such that  $a+c = b$

**Definition 2.3.** [3] Let  $G = (V, E \subset VXV)$  be the underlying graph with both  $V, E \neq \emptyset$ . For any semiring  $(S, +, \cdot)$  a semiring valued graph (or an  $S$ -valued graph)  $G^S$  is defined to be the graph  $G^S = (V, E, \sigma, \psi)$  where  $\sigma: V \rightarrow S$  and  $\psi: E \rightarrow S$  is defined to be

$$\psi(x, y) = \begin{cases} \min(\sigma(x), \sigma(y)), & \text{if } \sigma(x) \preceq \sigma(y) \text{ or } \sigma(y) \preceq \sigma(x) \\ 0 & \text{otherwise} \end{cases}$$

For every unordered pair  $(x, y)$  of  $E \subset VXV$  we call  $\sigma$  a  $S$ -vertex set and  $\psi$  an  $S$ -edge set of  $S$ -valued graph  $G^S$

**Definition 2.4.** [3] Consider the  $S$ -valued graph  $G^S = (V, E, \sigma, \psi)$ . For  $v_i \in V$ , the open neighborhood of  $v_i$  in  $G^S$  is defined as a subset of  $V \times S$  such that that

$N_S(v_i) = \{(v_i, \sigma(v_j)) / (v_i, v_j) \in E, \psi(v_i, v_j) \in S\}$ . For  $v_i \in V$  a closed neighborhood of  $v_i$  in  $G^S$  is defined to be the subset of  $V \times S$  such that  $N_S[v_i] = N_S(v_i) \cup \{(v_i, \sigma(v_i))\}$

**Definition 2.5.** [3] The degree of the vertex  $v_i$  of the  $S$ -valued graph  $G^S$  is defined as

$$deg_S(v_i) = (\sum_{(v_i, v_j) \in E} \psi(v_i, v_j), l) \quad \text{where } l \text{ is the number of edges incident with } v_i$$

**Definition 2.6.** [3] In the  $S$ -valued graph  $G^S = (V, E, \sigma, \psi)$ , to compare the degrees of two vertices  $v, w \in G^S$ , we define the  $\preceq$  as follows:

- $(\sigma(v), deg(v)) \preceq (\sigma(w), deg(w)) \Leftrightarrow (\sigma(v) \preceq \sigma(w))$  and  $deg(v) \leq deg(w)$
- If  $(\sigma(v) \preceq \sigma(w))$  and  $deg(v) \geq deg(w)$ , the comparison is with respect to the  $S$ -values

**Definition 2.7.** [3] Let  $G^S = (V, E, \sigma, \psi)$  be a given  $S$ -valued graph. A vertex  $v$  in  $G^S$  is said to be a weight dominating vertex if  $\sigma(u) \preceq \sigma(v) \forall u \in N_S[v]$

**Definition 2.8.** [3] A subset  $D \subseteq V$  is called a weight dominating vertex set of  $G^S$  if for each  $v \in D$   $\sigma(u) \preceq \sigma(v) \forall u \in N_S[v]$ . The minimum cardinality of a weight dominating set of  $G^S$  is called a weight domination number of  $G^S$  which is denoted by  $\gamma^S(G^S)$  and the corresponding weight dominating set is called a  $\gamma^S$ -set of  $G^S$ .

**Definition 2.9.** [3] Let  $G^S = (V, E, \sigma, \psi)$  be a given  $S$ -valued graph. The cardinality of the minimal weight dominating vertex set  $D \subseteq V$  is called the weight dominating vertex number of  $G^S$  which is denoted by  $\gamma^S(G^S)$  That is

$$\gamma^S(G^S) = \min\{|D|_s, |D| / D \text{ is a weight dominating set vertex set of } G^S\}$$

Here  $|D|_s$  denotes the scalar cardinality of  $D$  and  $|D|$  denotes the number of vertices in  $D$

**Definition 2.10.** [3] Let  $G^S = (V, E, \sigma, \psi)$  be a given  $S$ -valued graph. If  $D$  is a weight dominating vertex set of  $G^S$  then the scalar cardinality of  $D$  denoted by  $|D|_s$  is defined by  $|D|_s = \sum_{v \in D} \sigma(v)$

**Definition 2.11.** [1] The complement  $\bar{G}$  of a simple graph  $G$  is the simple graph with vertex set  $V$ , two vertices being adjacent in  $\bar{G}$  iff they are not adjacent in  $G$ .

**Definition 2.12.** [1] A Dominating set  $D \subseteq V$  of a graph  $G$  is said to be a global dominating set if  $D$  is also a dominating set in the complement of  $G$ .

### 3. PARTIAL WEIGHT DOMINATING VERTEX SETS IN S-VALUED GRAPHS

**Definition 3.1.** For any  $S$  – valued graph  $G^S$  and proportion  $p \in [0,1]$  with some  $\alpha \in S$  a set  $D \subseteq V$  is a  $(\alpha,p)$  partial weight dominating vertex set if  $(\alpha,p) \preceq (|N(D)|_S, |N(D)|/|V|)$

**Definition 3.2.** The  $(\alpha,p)$  partial weight domination number  $\gamma_{(\alpha,p)}(G^S)$  is the minimum cardinality of a  $(\alpha,p)$  partial weight dominating vertex set of  $G^S$  and it is given by  $\gamma_{(\alpha,p)}(G^S) = \min\{|D|_S, |D|\}$  where  $D$  is a  $(\alpha,p)$  partial weight dominating vertex of  $G^S$  where  $|D|_S$  denotes the scalar cardinality of  $D$  and  $|D|$  denotes the number of vertices in  $D$ .

Here we note that a  $\gamma_{(\alpha,p)}$  set is not in general related to a  $\gamma$ - set. In particular a  $\gamma$ - set does not necessarily contain a  $\gamma_{(\alpha,p)}$  set. Equivalently a  $\gamma_{(\alpha,p)}$  set can not necessarily be extended to  $\gamma$ - set.

Clearly  $(0,1) \preceq \gamma_{(\alpha,p)}(G^S) \preceq \gamma(G^S)$  and  $\gamma_{(\alpha,1)}(G^S) = \gamma(G^S)$

For example, we say that a set  $D \subseteq V$  is a  $1/2$ - weight dominating vertex set if  $(\alpha,1/2) \preceq (|N(D)|_S, |N(D)|/|V|)$ . The  $1/2$ -weight domination number  $\gamma_{(\alpha,1/2)}$  equals the minimum cardinality of a  $1/2$ - weight dominating vertex set in  $G^S$

#### Example 3.3.

consider the semiring  $(S = \{0, a, b, c\}, +, \cdot)$  with the following Cayley tables.

+	0	a	b	c
0	0	a	b	c
a	A	a	b	c
b	B	b	b	b
c	C	c	b	b

•	0	a	b	c
0	0	0	0	0
a	0	0	a	0
b	0	a	b	c
c	0	0	c	c

Let  $\preceq$  be a canonical preorder in  $S$  given by

$$0 \preceq 0, 0 \preceq a, 0 \preceq b, 0 \preceq c, a \preceq a, a \preceq b, a \preceq c, b \preceq b, c \preceq c, c \preceq b$$

Here  $\sigma: V \rightarrow S$  and  $\psi: E \rightarrow S$  are defined to be  $\sigma(v_1) = \sigma(v_6) = \sigma(v_3) = b$ ,  $\sigma(v_2) = \sigma(v_4) = c$ ,  $\sigma(v_5) = a$  and

$$\Psi(v_1v_2) = \Psi(v_2v_3) = \Psi(v_1v_4) = \Psi(v_2v_4) = c, \Psi(v_1v_6) = a, \Psi(v_3v_6) = b \text{ and } \Psi(v_4v_5) = \Psi(v_3v_5) = c$$

Consider the  $S$  – valued graph  $G^S = (V, E, \sigma, \psi)$

Let us fix  $\alpha$  to be  $a$

Consider the proportion  $p$  to be  $1/2$  then the  $(\alpha, p)$  partial weight dominating vertex set is  $D = \{(v_1, \sigma(v_1))\}$

$$N(D) = \{(v_1, \sigma(v_1)), (v_2, \sigma(v_2)), (v_6, \sigma(v_6))\}$$

$$|N(D)|_S = \sigma(v_1) + \sigma(v_2) + \sigma(v_6) = b + c + b = b \text{ and } |N(D)| = 3$$

Here  $(\alpha, p) \preceq (|N(D)|_S, |N(D)|/|V|)$

$$(a, 1/2) \preceq (b, 3/6)$$

$$\preceq (b, 1/2)$$

Here the  $(\alpha, 1/2)$  partial weight domination number  $\gamma_{(\alpha, 1/2)}(G^S) = (b, 1)$

**Example 3.3:** Consider  $K_{2,3}^S$  with the semiring mentioned in example 1

Let  $\preceq$  be a canonical preorder in  $S$  given by

$$0 \preceq 0, 0 \preceq a, 0 \preceq b, 0 \preceq c, a \preceq a, a \preceq b, a \preceq c, b \preceq b, c \preceq c, c \preceq b$$

Here  $\sigma: V \rightarrow S$  and  $\psi: E \rightarrow S$  are defined to be  $\sigma(v_1) = \sigma(v_3) = b$ ,  $\sigma(v_2) = \sigma(v_5) = a$ ,  $\sigma(v_4) = c$  and

$$\Psi(v_2v_3) = \Psi(v_2v_4) = \Psi(v_2v_5) = \Psi(v_1v_5) = a, \Psi(v_1v_3) = b \text{ and } \Psi(v_1v_4) = c$$

Choose  $\alpha = a$  and  $p$  to be  $1/2$

Consider  $D = \{(v_1, \sigma(v_1))\}$

$$N(D) = \{(v_1, \sigma(v_1)), (v_3, \sigma(v_3)), (v_4, \sigma(v_4)), (v_5, \sigma(v_5))\}$$

$$|N(D)|_S = \sigma(v_1) + \sigma(v_3) + \sigma(v_4) + \sigma(v_5) = b + a + c + b = b \text{ and } |N(D)| = 4$$

Then  $(\alpha, p) \preceq (|N(D)|_S, |N(D)|/|V|)$

$$(a, 1/2) \preceq (b, 4/5)$$

$$\gamma_{(\alpha, p)}(K_{2,3}^S) = (\sum_{v \in V} \sigma(v), 1)$$

#### 4. RESULTS ON PARTIAL WEIGHT DOMINATION NUMBER

**Proposition 4.1:** Let  $G^S$  be a  $S$ -valued graph on  $n$  vertices then  $\gamma_{(\alpha, p)}(G^S) = (\sum_{v \in V} \sigma(v), 1)$  for all  $p \in (0, \frac{\Delta+1}{n}]$

**Proposition 4.2:** Let  $G^S$  be a  $S$ -valued graph on  $n$  vertices then  $\gamma_{(\alpha, p)}(G^S) = \gamma(G^S)$  for all  $p \in (1 - 1/n, 1]$

**Proposition 4.3:** Let  $C_n^S$  be the  $S$ -valued cycle on  $n$  vertices and  $P_n^S$  be the  $S$ -valued path on  $n$  vertices then  $\gamma_{(\alpha, p)}(C_n^S) = \gamma_{(\alpha, p)}(P_n^S) = (\sum_{v \in V} \sigma(v), \lceil \frac{np}{3} \rceil)$

Proof: Let  $D$  be a  $(\alpha, p)$  partial weight dominating vertex set of  $C_n^S$  then  $|N(D)|_S \preceq \sum_{v \in V} \sigma(v)$  and  $\lceil \frac{np}{3} \rceil \leq |N(D)|$

To dominate  $\lceil np \rceil$  vertices in  $C_n^S$ , we need at least  $\lceil \frac{np}{3} \rceil$  vertices then

$$\gamma_{(\alpha,p)}(C_n^S) = (\sum_{v \in V} \sigma(v), |D|) \text{ and } |D| = \left\lfloor \frac{np}{3} \right\rfloor = \left\lceil \frac{np}{3} \right\rceil$$

$$\text{Hence } \gamma_{(\alpha,p)}(C_n^S) = \left( \sum_{v \in V} \sigma(v), \left\lceil \frac{np}{3} \right\rceil \right)$$

$$\text{Similarly } \gamma_{(\alpha,p)}(P_n^S) = \left( \sum_{v \in V} \sigma(v), \left\lceil \frac{np}{3} \right\rceil \right)$$

**Proposition 4.4:** For any S-valued complete graph vertices  $K_n^S$ ,  $\gamma_{(\alpha,p)}(K_n^S) = (\sum_{v \in V} \sigma(v), 1)$

**Proposition 4.5:** For any S – valued complete bipartite graph  $K_{m,n}^S$  with  $2 \leq m \leq n$ ,

$$\gamma_{(\alpha,p)}(K_{m,n}^S) = \begin{cases} (\sum_{v \in V} \sigma(v), 1) & \text{if } 0 \leq p \leq \frac{m+1}{m+n} \\ (\sum_{v \in D} \sigma(v), 2), & \text{if } p \leq \frac{m+1}{m+n} \leq 1 \end{cases}$$

Now we compare  $\gamma_{(\alpha,p)}(G^S)$  and  $\gamma_{(\alpha,q)}(G^S)$  for different proportions p and q.

**Proposition 4.6:** Let  $0 \leq p < q \leq 1$  for some  $\alpha \in S$  then  $\gamma_{(\alpha,p)}(G^S) \preceq \gamma_{(\alpha,q)}(G^S)$

Proof: We know that every  $(\alpha,q)$  partial weight dominating vertex set of  $G^S$  is a  $(\alpha,p)$  partial weight dominating vertex set of  $G^S$ .

More over equality holds if and only if the  $\gamma_{(\alpha,p)}$  partial weight dominating vertex set dominates a proportion q of the vertices.

Setting  $q=1$  we get  $\gamma_{(\alpha,1)}(G^S) = \gamma(G^S)$

We get a relation between weight domination number and partial weight domination number.

**Corollary 4.6.1:** The upper bound for partial weight domination number is given by

$$\gamma_{(\alpha,1)}(G^S) \preceq \gamma(G^S)$$

**Theorem 4.7:** Let  $G^S$  be a S-valued graph with weight domination number  $\gamma(G^S)$  then for all

$$p \in (0,1) \gamma_{(\alpha,p)}(G^S) + \gamma_{(\alpha,1-p)}(G^S) \preceq \gamma(G^S) + (\sum_{v \in V} \sigma(v), 1)$$

Proof: Let D be a  $\gamma(G^S)$  set and  $p \in (0,1)$ . Let  $D_1$  be the subset of D with  $np \geq |N(D_1)|$  and  $|N(D_1)|_S = \sum_{v \in V} \sigma(v)$  such that  $D_1$  is a minimal subset of D with this property. Clearly  $\gamma_{(\alpha,p)}(G^S) \preceq (\sum_{v \in V} \sigma(v), |D_1|)$ .

Let  $D_2 = D \setminus D_1$  and  $(v, \sigma(v)) \in D_1$

Since  $D_1$  is minimal with respect to the above property we have  $|N(D_1 \setminus (v, \sigma(v)))| < np$

Now, as  $D = (D_1 \setminus (v, \sigma(v))) \cup D_2 \cup \{(v, \sigma(v))\}$

$$n = |V| = N(D)$$

$$\leq N[(D_1 \setminus (v, \sigma(v)))] + N[D_2 \cup \{(v, \sigma(v))\}]$$

$$< np + N[D_2 \cup \{(v, \sigma(v))\}]$$

$$N[D_2 \cup \{(v, \sigma(v))\}] > n(1-p)$$

Thus  $D_2 \cup \{(v, \sigma(v))\}$  is an  $(1-p)$  partial weight dominating vertex set of  $G^S$  and

$$\gamma_{(\alpha,1-p)}(G^S) = (|D_2 \cup \{(v, \sigma(v))\}|_S, |D_2 \cup \{(v, \sigma(v))\}|)$$

$$\gamma_{(\alpha,1-p)}(G^S) \preceq ((\sum_{v \in V} \sigma(v), |D_2| + 1),$$

$$\gamma_{(\alpha,p)}(G^S) + \gamma_{(\alpha,1-p)}(G^S) \preceq ((\sum_{v \in V} \sigma(v), |D_1| + |D_2| + 1),$$

$$\preceq ((\sum_{v \in V} \sigma(v), |D| + 1)$$

$$\preceq \gamma(G^S) + (\sum_{v \in V} \sigma(v), 1)$$

**Theorem 4.8:** Let  $G^S$  be a S-valued graph with weight domination number  $\gamma(G^S)$ . For any positive integer  $k \geq 2$  with  $p_1 + p_2 + \dots + p_k \leq 1$  and  $p_i \in (0, 1)$  for all  $i$ ,  $\gamma_{(\alpha, p_1)}(G^S) + \gamma_{(\alpha, p_2)}(G^S) + \dots + \gamma_{(\alpha, p_k)}(G^S) \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), k/2)$

Proof: We prove it by induction on  $k$ .

For  $k=2$ ,  $p_1 + p_2 \leq 1$ , hence by above theorem,

$$\gamma_{(\alpha, p_1)}(G^S) + \gamma_{(\alpha, p_2)}(G^S) \leq \gamma_{(\alpha, p)}(G^S) + \gamma_{(\alpha, 1-p)}(G^S) \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), 1)$$

Assume that  $k > 2$  and the theorem holds for integers less than  $k$ . Then at least one value of  $p_i$  must satisfy  $p_i \leq 1/2$ . Without loss of generality, let  $p_k \leq 1/2$ . By Corollary 4.1

$$\gamma_{(\alpha, 1/2)}(G^S) \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), \lceil 1/2 \rceil)$$

Finally using the induction hypothesis, we get

$$\begin{aligned} & [\gamma_{(\alpha, p_1)}(G^S) + \gamma_{(\alpha, p_2)}(G^S) + \dots + \gamma_{(\alpha, p_{k-1})}(G^S)] + \gamma_{(\alpha, p_k)}(G^S) \\ & \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), \frac{k-1}{2}) + \gamma(G^S) + (\sum_{v \in V} \sigma(v), \lceil 1/2 \rceil) \\ & \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), k/2) \end{aligned}$$

Hence proved the theorem.

**Theorem 4.9:** Let  $G^S$  be a S-valued graph with components  $G_1^S, G_2^S, \dots, G_k^S$ . Then

$$\gamma_{(\alpha, p)}(G^S) \leq \sum_{i=1}^k \gamma_{(\alpha, p)}(G_i^S)$$

Proof: Let  $D_i$  be a  $\gamma_{(\alpha, p)}$  set of  $G_i^S$ , for  $i=1, 2, \dots, k$ . Then  $p|V(G)| \leq |N(D_i)|$  for  $i=1, 2, \dots, k$ .

Let  $D = D_1 \cup D_2 \cup \dots \cup D_k$ . Thus  $|N(D)| = \sum_{i=1}^k |N(D_i)|$

$p \sum_{i=1}^k |V(G_i^S)| \leq \sum_{i=1}^k |N(D_i)|$  and therefore  $p|V(G)| \leq |N(D)|$  and  $D$  is a  $\gamma_{(\alpha, p)}$  set of  $G^S$  and hence  $\gamma_{(\alpha, p)}(G^S) \leq \sum_{i=1}^k \gamma_{(\alpha, p)}(G_i^S)$

**Theorem 4.10:** For any connected S-valued graph  $G^S$   $\gamma_{(\alpha, i/j)}(G^S) \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), \lceil i/j \rceil)$

Proof: Given a  $\gamma$ -set  $D = \{(v_1, \sigma(v_1)), (v_2, \sigma(v_2)) \dots \dots (v_r, \sigma(v_r))\}$  partition  $V$  into sets  $D_1, D_2, \dots, D_r$  such that  $D_i \subseteq N[v_i]$ ,  $v_i \in D_i$

Without loss of generality,  $|D_1| \geq \dots \geq |D_r|$ .

Define  $D' = \{(v_1, \sigma(v_1)), (v_2, \sigma(v_2)) \dots \dots (v_{\lceil ir/j \rceil}, \sigma(v_{\lceil ir/j \rceil}))\}$

Claim:  $|\bigcup_{k=1}^{\lceil ir/j \rceil} D_k| \geq i/j |V|$

By construction  $|\bigcup_{k=1}^{\lceil ir/j \rceil} D_k| + |\bigcup_{k=\lceil ir/j \rceil+1}^r D_k| = |V|$

Since the average size of  $D_k$ ,  $k=1, 2, \dots, \lceil ir/j \rceil$  is at least the average size of all  $D_k$ 's, the result become true because at worst  $|D_k| = |D_l|$  for all  $k \neq l$  and here  $|\bigcup_{k=1}^{\lceil ir/j \rceil} D_k| \geq i/j |V|$

**Corollary 4.10.1:** For any connected S-valued graph  $G^S$   $\gamma_{(\alpha, 1/2)}(G^S) \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), \lceil 1/2 \rceil)$

Next consider some Nordhaus-Gaddum type bounds on the  $i/j$ -partial weight domination number on S-valued graphs

**Theorem 4.11:** If  $G^S$  and  $\bar{G}^S$  are connected S-valued graphs then  $\gamma_{(\alpha, i/j)}(G^S) + \gamma_{(\alpha, i/j)}(\bar{G}^S) \leq (\sum_{v \in V} \sigma(v), n + 2\lceil i/j \rceil)$

Proof: Applying theorem for both  $G^S$  and  $\bar{G}^S$  we get that

$$\gamma_{(\alpha, i/j)}(G^S) \leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), \lceil i/j \rceil)$$

$$\gamma_{(\alpha, i/j)}(\bar{G}^S) \leq \gamma(\bar{G}^S) + (\sum_{v \in V} \sigma(v), \lceil i/j \rceil)$$

Adding these two gives

$$\begin{aligned} \gamma_{(\alpha, i/j)}(G^S) + \gamma_{(\alpha, i/j)}(\bar{G}^S) &\leq \gamma(G^S) + (\sum_{v \in V} \sigma(v), \lceil i/j \rceil) + \gamma(\bar{G}^S) + (\sum_{v \in V} \sigma(v), \lceil i/j \rceil) \\ &\leq \gamma(G^S) + \gamma(\bar{G}^S) + (\sum_{v \in V} \sigma(v), 2\lceil i/j \rceil) \end{aligned}$$

$\leq (\sum_{v \in V} \sigma(v), n) + (\sum_{v \in V} \sigma(v), 2\lceil i/j \rceil)$  since we already had if  $G^S$  has no S-isolates then  $\gamma(G^S) + \gamma(\bar{G}^S) \leq (\sum_{v \in V} \sigma(v), n)$  where n is the number of vertices of  $G^S$

$$\leq (\sum_{v \in V} \sigma(v), n + 2\lceil i/j \rceil)$$

**Corollary 4.11.1:** If  $G^S$  and  $\bar{G}^S$  are connected S-valued graphs then

$$\gamma_{(\alpha, 1/2)}(G^S) + \gamma_{(\alpha, 1/2)}(\bar{G}^S) \leq (\sum_{v \in V} \sigma(v), n + 2)$$

## 5. CONCLUSIONS:

In S-valued graphs, we derived some results for partial weight dominating vertex sets and partial weight domination number. Further we have to give the generalization result for the upper bound of this  $(\alpha, p)$ -partial weight domination for  $G^S$ .

**ABSTRACT:** *A within-host mathematical model on the inflammatory mediators in COVID-19 is presented. Homotopy Perturbation Method (HPM) is discussed which is used to compute an approximate analytical expression for the concentrations of healthy type II Pneumocytes, infected type II Pneumocytes and viral load. The validity of HPM is analyzed using the function `pde4`, a function used to solve boundary value problems in MATLAB software. Graphical results confirm that (HPM) is in good agreement with the numerical solution adding to the accuracy and efficiency of (HPM) in finding the solution of the proposed model. The achieved results are applicable to the entire domain.*

**Keywords:** *Mathematical Modeling, COVID-19, Nonlinear initial value problem, Homotopy Perturbation Method.*

## 1. INTRODUCTION:

The outbreak of novel coronavirus in Wuhan, China marked the introduction of a virulent coronavirus into human society. The causative agent of this disease is identified as Severe Acute Respiratory Syndrome coronavirus-2 (SARS-CoV-2). The transmission of SARS-CoV-2 from a person to another occurs either through droplet infection or by a direct contact with an infected host. Also, transmissions from asymptomatic carriers have also been reported. In spite of several researches being carried around the world, we are still lacking effective treatment approaches and epidemiological control measures. So, in order to break the natural history of the disease, it is inevitable to identify the possible interventions that help in reducing the severity of the virus and the growth of infected cells. Therefore, it is crucial to determine the coaction of viral growth along with the host immune response in the form of inflammatory mediators. In this paper, an analytical expression is derived for the ratio of healthy type II Pneumocytes  $S(t)$ , infected type II Pneumocytes  $I(t)$ , viral load  $V(t)$  against time  $t$  by applying the method of Homotopy Perturbation. These analytical expressions can be useful in predicting the course of the disease over time and the simulation of novel therapies under various mechanisms.

## 2. MATHEMATICAL FORMULATION OF THE PROBLEM :

Recently *D.K.K. Vamsi et al.* [1] formulated a mathematical model with reference to the pathogens that deals with the natural history of covid-19. This is a first of its kind. Up to our

knowledge there is no analytical solution for this system of nonlinear equations. The model is denoted as

$$\frac{dS}{dt} = \omega - \mu S - \beta SV \quad (1)$$

$$\frac{dI}{dt} = \beta SV - (d_1 + d_2 + d_3 + d_4 + d_5 + d_6)I - \mu I$$

$$\frac{dI}{dt} = \beta SV - DI - \mu I \quad (2)$$

$$\text{where } D = d_1 + d_2 + d_3 + d_4 + d_5 + d_6$$

$$\frac{dV}{dt} = \alpha I - (b_1 + b_2 + b_3 + b_4 + b_5 + b_6)V - \mu_1 V$$

$$\frac{dV}{dt} = \alpha I - BV - \mu_1 V \quad (3)$$

$$\text{where } B = b_1 + b_2 + b_3 + b_4 + b_5 + b_6$$

where  $S(t)$  represents the healthy type II Pneumocytes,  $I(t)$  represent the infected type II Pneumocytes, and  $V(t)$  represent the viral load. Let  $\omega$  be the natural birth rate of type II Pneumocytes. Let the natural birth rate of the virus  $V(t)$  be  $\alpha$  and the natural death rate be  $\mu_1$ . We suppose that infected type II Pneumocytes  $I(t)$  secrete virus  $V(t)$  that attacks the healthy type II Pneumocytes  $S(t)$  at rate  $\beta$  and the natural death rate of type II Pneumocytes be  $\mu$ . With the release of cytokines and chemokines IL-6 TNF- $\alpha$ , INF- $\alpha$ , CCL5, CXCL8, CXCL10, the infected Pneumocytes and the virus are removed at the rate  $B$  and  $D$  die at rate  $\mu_1$  respectively. The parameters  $\omega, \beta, \mu, \alpha, \mu_1, B, D$  are positive constants. The initial conditions for the above equations as  $t=0$  are  $S = S_i, I = I_i, V = V_i$ .

**Table 1**

Nomenclature

Parameters	Biological meaning
S	Healthy type II Pneumocytes
I	Infected Type II Pneumocytes
$\omega$	Natural birth rate of Type II Pneumocytes
V	Viral load
$\beta$	Rate at which healthy Pneumocytes are infected
$\alpha$	Burst rate of virus particles(rate at which infected cells release the virus particles)
$\mu$	Natural death rate of Type II Pneumocytes
$\mu_1$	Natural death rate of virus
$d_1, d_2, d_3, d_4, d_5, d_6$	Rates at which Infected Pneumocytes are removed because the release of cytokines and chemokines IL-6 TNF- $\alpha$ , INF- $\alpha$ , CCL5, CXCL8, CXCL10 respectively
$b_1, b_2, b_3, b_4, b_5, b_6$	Rates at which Virus is removed because of the release of cytokines and chemokines IL-6 TNF- $\alpha$ , INF- $\alpha$ , CCL5, CXCL8, CXCL10 respectively

### 3. ANALYTICAL SOLUTION FOR THE WITHIN-HOST MATHEMATICAL MODEL ON THE INFLAMMATORY MEDIATORS

Homotopy Perturbation method is a combination of topology and classic perturbation techniques. It is implemented to compute an approximate solution to a system of nonlinear differential equations pertaining to the problem. The efficiency of the Homotopy perturbation method for handling and solving various non-linear structures problems can be found in [2-5]. Ji Huan He employed the Homotopy perturbation method to solve the Lighthill equation [6], the Duffing equation [7] and the Blasius equation [8]. The homotopy perturbation method makes use of a small imbedding parameter  $p$  due to which very few iterations are required to achieve accurate result. The procedure for solving the non-linear differential equations, eqn. (1) - eqn. (3), by employing the method of homotopy perturbation is illustrated in Appendix A. The obtained results are as follows

$$S(t) = \frac{\omega}{\mu} + e^{-\mu t} \left( S_i - \frac{\omega}{\mu} \right) + \frac{\beta V_i \omega}{\mu B} (e^{-t(\mu+B)} - 1) + \frac{\beta V_i}{\mu + B} (e^{-t(2\mu+B)} - 1) \left( S_i - \frac{\omega}{\mu} \right) \quad (4)$$

$$I(t) = I_i e^{-t(D+\mu)} + \frac{\beta S_i V_i}{\mu + B - D} (1 - e^{-t(2\mu+B)}) \quad (5)$$

$$V(t) = V_i e^{-t(B+\mu)} + \frac{\alpha I_i}{D - B} (1 - e^{-t(D-B)}) \quad (6)$$

where  $S(t)$  represents the healthy type II Pneumocytes,  $I(t)$  represent the infected type II Pneumocytes, and  $V(t)$  represent the viral load.

### 4. NUMERICAL SIMULATION

By implementing the Homotopy Perturbation Method, the non-linear differential equations governing the model (1)-(3) for the predetermined initial condition are established. These equations are illustrated numerically by making use of Matlab pde4. The obtained solutions in comparison with the analytical solutions admit a remarkable accuracy.

### 5. RESULT AND DISCUSSION

Fig. 1 illustrates the ratio of healthy type II Pneumocytes  $S(t)$ , infected type II Pneumocytes  $I(t)$ , viral load  $V(t)$  against time  $t$ . Fig. 2-4 presents plot of the ratio of healthy type II Pneumocytes  $S(t)$  against time  $t$  by varying parameters  $R1, R2, R3$  respectively. From Fig 2, it can be noted that the ratio of healthy type II Pneumocytes  $S(t)$  increases steadily due to the increase in natural birth rate of type II Pneumocytes. From Fig. 3, it can be seen that there is an deterioration in the ratio of healthy type II Pneumocytes  $S(t)$ . This is due to the increase in rate at which healthy Pneumocytes are infected. Fig. 4 depicts that there is an decline in the ratio of healthy type II Pneumocytes  $S(t)$  which is a consequence of the natural death rate of these cells. Fig. 5-6 presents plot of the ratio of infected type II Pneumocytes  $I(t)$  against time  $t$  by varying parameters  $R3, R4$  respectively. From Fig. 5, it can be observed that the ratio of infected type II Pneumocytes  $I(t)$  decreases steadily due to the increase in natural death rate of type II Pneumocytes. From Fig. 6, it can be noted that when the infected type II Pneumocytes are removed from the host the ratio of infected type II Pneumocytes  $I(t)$  decreases. From this it can be inferred that the immunization drugs play a pivot role in stopping

the spread of the infected cells. Fig. 7- 9 represents plot of the ratio of viral load  $V(t)$  against time  $t$  by varying parameters  $R5, R6, R7$  respectively. From Fig. 7, it can be noted that when the rate of removal of the virus from the host is high the ratio of the viral load decreases. From Fig. 8, it can be seen that ratio of the viral load  $V(t)$  decreases as the death rate of the virus increases. From Fig. 9, it can be observed that ratio of the viral load  $V(t)$  increases when the rate of release of the virus from the infected cells is maximum. The higher the infected cells, the higher the viral load. Therapeutic agents which acts to improve the response of the host immune system in reducing the number of infected cells and viral load can be administered.

## 6. EXISTENCE AND UNIQUENESS OF THE SOLUTION :

### Theorem 1 (Uniqueness of solution)

Let D denote the domain:

$$|t - t_0| \leq a, \|x - x_0\| \leq b, x = (x_1, x_2, \dots, x_n), x_0 = (x_{10}, x_{20}, \dots, x_{n0}) \quad (6.1)$$

And suppose that  $f(t, x)$  satisfies the lipschitz condition:  $\|f(t, x_1) - f(t, x_2)\| \leq k\|x_1 - x_2\|$ , (6.2)

And whenever the pair  $(t, x_1)$  and  $(t, x_2)$  belong to domain D, where k is used to represent a positive constant.

Then, there exist a constant  $\delta > 0$  such that there exist a unique (exactly One) continuous vector solution  $x(t)$  of the system  $x' = f(t, x), x(t_0) = x_0$  in the interval  $\|t - t_0\| \leq \delta$ .

It is important to note that the condition (6.2) is satisfied by requirement that :

$$\frac{\partial f_i}{\partial x_j}, \quad i, j = 1, 2, \dots, n \text{ be continuous and bounded in the domain D}$$

### Lemma 1:

If  $f(t, x)$  has continuous partial derivative  $\frac{\partial f_i}{\partial x_j}$ , on a bounded closed convex domain  $\mathbf{R}$

(i.e, convex set of real numbers), where  $\mathbf{R}$  is used to denotes real numbers , then it satisfies a Lipschitz condition in  $\mathbf{R}$ . Our interest is in the domain:

$$1 \leq \epsilon \leq \mathbf{R}. \quad (6.3)$$

So, we look for a bounded solution of the form  $0 < \mathbf{R} < \infty$

### Theorem 2:

Let D denote the domain defined in (6.1) such that (6.2) and (6.3) hold. Then there exist a solution of model system of equations (1)-(4) which is bounded in the domain D.

### Proof:

$$\text{Let } f_1 = \omega - \mu S - \beta SV \quad (6.4)$$

$$f_2 = \beta SV - DI - \mu I \quad (6.5)$$

$$f_3 = \alpha I - BV - \mu V \quad (6.6)$$

We prove that  $\frac{\partial f_i}{\partial x_j}$ ,  $i, j = 1, 2, \dots, n$  is continuous and bounded, Then the partial derivative

of all the model equations are as follows.

$$\text{From equation (6.4), } \frac{\partial f_1}{\partial S} = -\mu - \beta V, \left| \frac{\partial f_1}{\partial S} \right| = |-\mu - \beta V| < \infty, \quad \frac{\partial f_1}{\partial I} = 0, \left| \frac{\partial f_1}{\partial I} \right| = 0 < \infty,$$

$$\frac{\partial f_1}{\partial V} = -\beta S, \left| \frac{\partial f_1}{\partial V} \right| = |-\beta S| < \infty,$$

$$\text{From equation (6.5), } \frac{\partial f_2}{\partial S} = \beta V, \left| \frac{\partial f_2}{\partial S} \right| = |\beta V| < \infty, \quad \frac{\partial f_2}{\partial I} = -D - \mu, \left| \frac{\partial f_2}{\partial I} \right| = |-D - \mu| < \infty,$$

$$\frac{\partial f_2}{\partial V} = \beta S, \left| \frac{\partial f_2}{\partial V} \right| = |\beta S| < \infty,$$

From equation (6.6),  $\frac{\partial f_3}{\partial S} = 0 \left| \frac{\partial f_3}{\partial S} \right| = |0| < \infty$ ,  $\frac{\partial f_3}{\partial I} = \alpha, \left| \frac{\partial f_3}{\partial I} \right| = |\alpha| < \infty$ ,

$$\frac{\partial f_3}{\partial V} = -\beta - \mu_1, \left| \frac{\partial f_3}{\partial V} \right| = |-\beta - \mu_1| < \infty,$$

Since all these partial derivatives are continuous and bounded, by Theorem (1), we can say that there exist a unique solution of (1)-(4) in the region D.

## 7. CONCLUSION :

In this paper, HPM is employed to attempt the solution of the model. Numerical simulations were performed to compare the analytical results obtained by HPM with numerical results. The results of the simulations were illustrated graphically. The results show that the analytical solution is in good agreement with the numerical results and produced accurately the same behavior. A clear conclusion can be drawn that HPM is highly reliable in finding the solution of a nonlinear differential Equation.

**ABSTRACT:** *Simple mathematical model for a bioreactor in batch mode with decay is presented. The two-dimensional differential system describing the dynamics of the substrate and biomass concentrations can be reduced to an algebraic equation for the biomass together with a single differential equation for the substrate from an analogy with the Henri Michaelis–Menten enzyme kinetic mechanism. The existence and uniqueness of the solution for the bioreactor model is discussed. The simple and closed form analytical expressions for the concentrations of biomass, and substrate have been derived by using New Homotopy Perturbation method for all values of parameter. Furthermore, in this work the numerical simulation of the problem is also reported using Matlab program to investigate the dynamics of the system. Graphical results are presented and discussed quantitatively to illustrate the solution. A satisfactory agreement between analytical and numerical results is noted.*

**Keywords:** *Mathematical Modeling, Bioreactor Model, New Homotopy Perturbation Method.*

## 1. INTRODUCTION:

A **bioreactor** may refer to any manufactured or engineered device or a system that supports a biologically active environment in which living organisms and especially bacteria synthesize useful substances (as interferon) or break down harmful ones (as in sewage). This process can either be aerobic or anaerobic. They are commonly cylindrical, ranging in size from litres to cubic metres, and are often made of stainless steel. These devices are being developed for use in tissue engineering or biochemical engineering [1-4].

### Application of bioreactor:

1. Producing biologic end-products (production bioreactor);
2. Cell or stem cell expansion (cell bioreactor); and
3. Tissue engineering (tissue bioreactor).

### Mathematical formulation:

The two-dimensional differential system describing the dynamics of the substrate and biomass concentrations can be reduced to an algebraic equation for the biomass together with a single differential equation for the substrate. Then from an analogy with the Henri– Michaelis – Menten enzyme kinetic mechanism a simple model is proposed for a bioreactor in batch mode with decay [4].

### 2. TERMIMOLOGY AND DIFFERENTIAL EQUATIONS:

We investigate (in the spirit of [4]) some models of batch mode bioreactors with decay of the form:

$$\frac{ds}{dt} = -\alpha\mu(s)x \quad (1)$$

$$\frac{dx}{dt} = \mu(s)x - k_d x \quad (2)$$

### Monod function [5]:

$$\mu_m(s) = \mu^* \frac{s}{K + s} \quad (3)$$

Substitute equation (3) in eqn. (1) & (2)

$$\frac{ds}{dt} = \frac{-\alpha \mu^* sx}{K + s} \quad (4)$$

$$\frac{dx}{dt} = \frac{\mu^* sx}{K + s} - k_d x \quad (5)$$

with positive initial conditions and positive  $\alpha$  and  $k_d$ . Here  $s(t)$  is the concentrations of the substrate at time  $t$ ,  $x(t)$  is concentration of biomass at time  $t$ ,  $\mu^* = \mu_{\max}$  is the maximum specific substrate degradation rate,  $k_d$  is a decay (death rate) constant,  $\mu(s)$  is a function depending on the substrate  $s$ ,  $\alpha$  the growth yield coefficient.

$K$  are positive and represent different physical/biological quantities. With the initial conditions

$$\text{At } t=0, \quad s = s_i \quad (6)$$

$$\text{At } t=0, \quad x = x_i \quad (7)$$

### Webb function [6]:

$$\mu_w(s) = \frac{\mu^* s(1 + \frac{\beta s}{K_i})}{K + s + \frac{s^2}{K_i}} \quad (8)$$

Substitute equation (8) in eqn. (1) & (2)

$$\frac{ds}{dt} = \frac{-\alpha \mu^* s(1 + \frac{\beta s}{K_i})x}{K + s + \frac{s^2}{K_i}} \quad (9)$$

$$\frac{dx}{dt} = \frac{\mu^* s(1 + \frac{\beta s}{K_i})x}{K + s + \frac{s^2}{K_i}} - k_d x$$

(10)

With positive initial conditions and positive  $\alpha$  and  $k_d$ . Here  $s(t)$  is the concentrations of the substrate at time  $t$ ,  $x(t)$  is concentration of biomass at time  $t$ ,  $\mu^*$  does not represent the maximum of  $\mu_w(s)$ ,  $k_d$  is a decay (death rate) constant,  $\mu(s)$  is a function depending on the substrate  $s$ ,  $\alpha$  the growth yield coefficient,  $K$  &  $K_i$  are positive and represent different physical/biological quantities,  $K_i$  is the inhibition constant, numerically equals the highest substrate concentration at which the specific growth rate is equal to one-half the maximum specific growth rate in the absence of inhibition, mass/volume.  $\beta$  is the Product formation constant. With the initial conditions

$$\text{At } t=0, \quad s = s_i \quad (11)$$

$$\text{At } t=0, \quad x = x_i \quad (12)$$

**Nomenclature:**

Symbol	Meaning	Numerical value
$s$	Concentration of substrate	1
$x$	Biomass	1
$\alpha$	Growth yield coefficient	1.2
$\mu^*$	Maximum specific substrate Degradation rate	3
$k_d$	Decay constant	1.4
$K$	Different biological quantity	2.3
$\beta$	Product formation constant	0.1
$K_i$	Inhibition constant	1

**Uniqueness and Existence of Solution:**

**Lemma 3.1:** Let  $D \in \mathbb{R}^n$  and  $f : D \rightarrow \mathbb{R}$  be a non-linear vector field.  $f$  is continuous and Lipchitz in  $B = \{x \in D : \|x - x_0\| \leq r\}$  for some real  $r$  with  $r > 0$ . Then, there exists some  $\delta > 0$  such that  $x' = f(t, x)$ ,  $x(t_0) = x_0$ , has some unique solution.

**Theorem 3.1:** Suppose  $F_i(t, x)$ ,  $x(t_0) = x_0$ ,  $i = 1, 2, 3, 4, 5, 6$  exists and unique in solution. Then the system satisfies Lipchitz condition.

$$\frac{\partial f_i}{\partial t_j} \quad i, j = 1, 2, 3, 4$$

**Proof:** Using the above lemma, it is enough if we prove that

is continuous and bounded in D.

Let

$$f_1 = \frac{-\alpha \mu^* s x}{K+s}; \quad f_2 = \frac{\mu^* s x}{K+s} - k_d x; \quad f_3 = \frac{-\alpha \mu^* s (1 + \frac{\beta s}{K_i}) x}{K+s + \frac{S}{K_i}}; \quad f_4 = \frac{\mu^* s (1 + \frac{\beta s}{K_i}) x}{K+s + \frac{S}{K_i}} - k_d x$$

Now, we find the partial derivatives of these functions

$$\text{For } f_1, \quad \left| \frac{\partial f_1}{\partial s} \right| = \left| \frac{-\alpha \mu^* x}{K+s} \right| < \infty, \quad \left| \frac{\partial f_1}{\partial x} \right| = \left| \frac{-\alpha \mu^* s}{K+s} \right| < \infty$$

$$\text{For } f_2, \quad \left| \frac{\partial f_2}{\partial s} \right| = \left| \frac{-\alpha \mu^* x}{K+s} \right| < \infty, \quad \left| \frac{\partial f_2}{\partial x} \right| = \left| \frac{-\alpha \mu^* s}{K+s} - k_d \right| < \infty$$

$$\text{For } f_3, \quad \left| \frac{\partial f_3}{\partial s} \right| = \left| \frac{-\alpha \mu^* (1 + \frac{\beta s}{K_i}) x}{K+s + \frac{S}{K_i}} \right| < \infty, \quad \left| \frac{\partial f_3}{\partial x} \right| = \left| \frac{-\alpha \mu^* (1 + \frac{\beta s}{K_i}) s}{K+s + \frac{S}{K_i}} \right| < \infty$$

$$\text{For } f_4, \quad \left| \frac{\partial f_4}{\partial s} \right| = \left| \frac{\mu^* (1 + \frac{\beta s}{K_i}) x}{K+s + \frac{S}{K_i}} \right| < \infty, \quad \left| \frac{\partial f_4}{\partial x} \right| = \left| \frac{\mu^* s (1 + \frac{\beta s}{K_i})}{K+s + \frac{S}{K_i}} - k_d \right| < \infty$$

Since the partial derivatives are continuous and bounded, we can conclude that the systems admits a unique solution.

### Approximate Analytical Expression of the Concentration of substrate and biomass Using New Homotopy Perturbation Method (NHPM)

Presently, many authors have used the NHPM for solving various problems and have also exhibited its efficiency in solving the non-linear problems arising in the physics and engineering disciplines [7-10]. NHPM is the combination of topology and classical perturbation techniques. This has been used to solve non-linear boundary value problems, integral equations and many other problems [11]. Unlike other methods, NHPM uses only a few iterations to obtain an analytical expression and is very effective and simple. Using this method, we can obtain the following approximate solution for the concentration of substrate and biomass [4].

**Numerical Simulation:**

The non-linear differential eqns. (3.4)-(3.5), & (3.9)-(3.10) are solved using numerical methods. The function `ode4` in Matlab software is used to solve this equation. The numerical solutions are then compared with the approximate analytical results. It can be inferred that the numerical results is in a good agreement with all the experimental values of the model parameters.

**Monod function:**

### 3. RESULT AND DISCUSSIONS:

The primary result of eqn. (3.23) - eqn. (3.24) represents the simple analytical expression pertaining to the Concentration of Substrate & Biomass respectively. Figure (1-4) represents the comparison of analytical and numerical stimulation of concentration of substrate verses time for different values of  $\alpha, \mu^*, k_d, K$ . From figure (1-2), it is inferred that concentration of substrate decreases when  $k_d, K$  increases for some fixed values of other parameter. From figure (3-4), it is inferred that concentration of substrate decreases when  $\alpha, \mu^*$  decreases for some fixed values of other parameter. Figure (5-7) represents the comparison of analytical and numerical stimulation of concentration of biomass verses time for different values of  $\alpha, \mu^*, k_d, K$ . From figure (5-6), it is inferred that concentration of biomass decreases when  $k_d, K$  decreases for some fixed values of other parameter. From figure (7), it is inferred that concentration of biomass decreases when  $\mu^*$  increases for some fixed values of other parameter. The primary result of eqn. (3.35) - eqn. (3.36) represents the simple analytical expression pertaining to the Concentration of Substrate & Biomass respectively. Figure (8-13) represents the plot of concentration of substrate verses time for different values of  $\alpha, \mu^*, k_d, K, \beta, K_i$ . From figure (8-10), it is inferred that concentration of substrate decreases when  $k_d, K, K_i$  increases for some fixed values of other parameter. From figure (11-13), it is inferred that concentration of substrate decreases when  $\alpha, \mu^*, \beta$  decreases for some fixed values of other parameter. Figure (14-18) represents the plot of concentration of substrate verses time for different values of  $\mu^*, k_d, K, \beta, K_i$ . From figure (14-18), it is inferred that concentration of substrate decreases when  $k_d, K, K_i, \mu^*, \beta$  increases for some fixed values of other parameter.

### 4. CONCLUSION:

In this paper, the system of nonlinear differential equations on the concentration of substrate & biomass has been solved analytically. The analytical expressions pertaining to the concentration of substrate & biomass for all values of the parameters are obtained using the New Homotopy Perturbation method. The numerical simulation of Monod and Webb functions shows that the numerical results are in sound agreement with analytical results. This analytical result helps us for the dynamics of the model and to study the correlation between the model parameters.

# A STUDY ON DOUBLE LAYERED FUZZY GRAPH

**Dr. P. Mahalakshmi**

Assistant Professor, Department Of Mathematics  
V. H. N. S. N. College (Autonomous),  
Virudhunagar-626001, Tamil Nadu, India

**ABSTRACT:** In this paper, define a new fuzzy graph named Double Layered Fuzzy Graph (DLFG) and discussed some of its properties using order, size,  $\mu$  - complement of fuzzy graphs, etc. The concept of connectivity plays an important role in both theory and applications of fuzzy graphs. The relationship between the double layered fuzzy graph and the given fuzzy graph is a cycle are analyzed. Also, this paper generalizes the tree concept in fuzzy labeling graph, which plays an important role in many areas of science and technology.

**Keywords:** Fuzzy graph, Domination in Fuzzy graph, double layered fuzzy graph, domination in double layered fuzzy graphs, Perfect domination.

## 1. INTRODUCTION:

The theory of fuzzy sets has been an exponential growth both within mathematics and in its, applications, this ranges from traditional mathematical subjects like logic, topology, algebra, analysis etc. information theory, artificial intelligence, operation research, neural networks and planning etc... Consequently fuzzy set theory has emerged as a potential area of interdisciplinary research and fuzzy graph theory plays a vital role.

Rosenfeld in 1975 considered fuzzy relations on fuzzy sets and developed the theory of fuzzy graph, and then some basic fuzzy graph theoretic concepts and applications have been indicated, many authors found deeper results, and fuzzy analogues of many other graph theoretic concepts, this include fuzzy trees, fuzzy line graphs, operations on fuzzy graphs, automorphism of fuzzy graph, fuzzy interval graphs, cycles and co cycles of fuzzy graphs, bipartite fuzzy graph and metric aspects in fuzzy graph.

## 2. Fuzzy Sets:

A fuzzy set is a set whose elements have degree of membership. Fuzzy sets are an extension of the classical notion of set (known as a crisp set). A fuzzy set is a pair  $(A, A)$ , Where  $A$  is a set and  $A: A \rightarrow [0,1]$  for all  $x \in A$ ,  $(A)(X)$  is called a grade of membership of  $x$ . If  $A(X) = 1$ , then  $x$  is fully included in  $(A,A)$  and  $n_i$  if  $x$  is not included in  $(A,A)$ . If there exists some  $x \in A$ . Such that  $A(X) = 1$ , then say that  $(A,A)$  is normal. Otherwise, we say that  $(A,A)$  is subnormal.

In general a fuzzy set is denoted as  $A=A(X_1)/X_1+ (X_n)/x_n$  which belongs to a finite universal set. If  $A(x_i)/x_i$  (a singleton) is a pair then it is said to be a "grade of member ship element".

Complete Bipartite Graphs:

A complete bipartite graph is a bipartite graph  $G= (V,E)$  where  $v=v_1 v_2$ , such that for any two vertices  $v_1 \in V_1$  and  $v_2 \in V_2$ ,  $v_1, v_2$  is an edge in  $G$ . The complete bipartite graph with partitions  $|V_1|=m$  and  $|V_2|=n$  is denoted by  $K_{m,n}$ .

## Fuzzy Graphs

A fuzzy graph  $G = (V, \sigma, \mu)$  is a triple consisting of a nonempty set  $V$  together with a pair of functions  $\sigma : V \rightarrow [0, 1]$  and  $\mu : E \rightarrow [0, 1]$  such that for all  $x, y \in V$ ,  $\mu(xy) \leq \sigma(x) \wedge \sigma(y)$ .

The fuzzy set  $\sigma$  is called the fuzzy vertex set of  $G$  and  $\mu$  the fuzzy edge set of  $G$ .

Complete fuzzy Graph:

A fuzzy graph  $\tilde{G} = (\sigma, \mu)$  is said to be complete if  $\mu(u, v) = \sigma(u) \wedge \sigma(v)$ , for all  $u, v \in V$  and is denoted by  $K\sigma$ .

Example :

Let  $\tilde{G}$  be fuzzy graph Define  $\tilde{G} = (\sigma, \mu)$  by  $\sigma(u)=0.8, \sigma(v)=0.9, \sigma(w)=0.7, \sigma(x)=0.6$ , and  $\mu(u, v)=0.8, \mu(v, w)=0.7, \mu(w, x)=0.6, \mu(x, v)=0.6$ . Then  $\tilde{G} = (\sigma, \mu)$  is complete fuzzy graph

### 3. A complete fuzzy graph (K3)

To find double layered complete fuzzy graph

Let  $v_1=0.4, v_2=0.6, v_3=0.8, e_1=0.4, e_2=0.6, e_3=0.4$  be an edge set.

By definition for fuzzy graph

$$\mu(x, y) \leq \sigma(x) \wedge \sigma(y) = \min(\sigma(x), \sigma(y))$$

$$\mu(v_1, v_2) = \min(0.4, 0.6) = 0.4$$

$$\mu(v_2, v_3) = \min(0.6, 0.8) = 0.6$$

$$\mu(v_3, v_1) = \min(0.8, 0.4) = 0.4$$

$$\mu(e_1, e_2) = \min(0.4, 0.6) = 0.4$$

$$\mu(e_2, e_3) = \min(0.6, 0.4) = 0.4$$

$$\mu(e_3, e_1) = \min(0.4, 0.4) = 0.4$$

Consider the complete fuzzy graph with vertex 5 ,(K5)

**Theorem 1.1.**

If  $G_1 : (\sigma_1, \mu_1)$  and  $G_2 : (\sigma_2, \mu_2)$  are complete fuzzy graphs, then  $G_1 \sqcap G_2$  is complete.

Proof:

If  $(u_1, v_1)(u_2, v_2) \in E$ , then  $G_1$  and  $G_2$  are complete  
and  $(\mu_1 \sqcap \mu_2)((u_1, v_1)(u_2, v_2)) = \mu_1(u_1, u_2) \wedge \mu_2(v_1, v_2) = \sigma_1(u_1) \wedge \sigma_1(u_2) \wedge \sigma_2(v_1) \wedge \sigma_2(v_2)$   
 $= (\sigma_1 \sqcap \sigma_2)((u_1, v_1)) \wedge (\sigma_1 \sqcap \sigma_2)((u_2, v_2))$ .

Hence,  $G_1 \sqcap G_2$  is complete.

**Theorem 1.2**

If  $G_1 : (\sigma_1, \mu_1)$  and  $G_2 : (\sigma_2, \mu_2)$  are complete fuzzy graphs, then  $G_1 \bullet G_2$  is complete.

Proof :

If  $(u, v_1)$  and  $(u, v_2) \in E$ ,  
then  $(\mu_1 \bullet \mu_2)((u, v_1)(u, v_2)) = \sigma_1(u) \wedge \mu_2(v_1, v_2) = \sigma_1(u_1) \wedge \sigma_2(v_1) \wedge \sigma_2(v_2)$  (since  $G_2$  is complete)  
 $= (\sigma_1 \bullet \sigma_2)((u, v_1)) \wedge (\sigma_1 \bullet \sigma_2)((u, v_2))$ .

If  $(u_1, v_1)(u_2, v_2) \in E$ , then  $G_1$  and  $G_2$  are complete

If  $(\mu_1 \bullet \mu_2)((u_1, v_1)(u_2, v_2)) = \mu_1(u_1, u_2) \wedge \mu_2(v_1, v_2)$   
 $= \sigma_1(u_1) \wedge \sigma_1(u_2) \wedge \sigma_2(v_1) \wedge \sigma_2(v_2)$   
 $= (\sigma_1 \bullet \sigma_2)((u_1, v_1)) \wedge (\sigma_1 \bullet \sigma_2)((u_2, v_2))$ .

Hence,  $G_1 \bullet G_2$  is complete.

**5. CONCLUSION :**

Fuzzy graphs have numerous applications in different parts of Science and Engineering like broadcast communications, producing, Social Network, man-made reasoning, data hypothesis, neural systems etc.

## 1. INTRODUCTION

The two classes of abstract algebras namely BCK-algebras and BCI-algebras were introduced by Imai Y and Iseki K [6]. It is known that the class of BCK-algebras is a proper subclass of the class of BCI-algebras. Hu Q P and Li X [5] introduced a wide class of abstract algebras: BCH-algebras. Also it is known that the class of BCI-algebras is a proper subclass of the class of BCH-algebras. Ahn S.S and Han J.S [1] introduced the concepts of BP-algebras and they discussed some relations with BF-algebras. Alo R and Deeba E [3] attempted to study the topological concepts of the BCK-structure. Ahn S.S and Kwon S H [2] studied the topological properties in BCC-algebras. Dudeck W A and Zhang X [4] discussed on ideals and congruence in BCC-algebras. In 2017, Jansi M and Thiruveni V [7] studied the topological structures on BCH-Algebras. In 2019, they [8] also introduced topological BCH-groups. Recently, Complementary Role of Ideals in TSBF-algebras was discussed by Jansi M and Thiruveni V [9]. Nagamani N and Kandaraj N [10, 11] discussed the topological concepts and structures on d-algebras.

Motivated by this, in this paper, we study the issue of attaching topologies to BP-algebras in as natural a manner as possible. We may use the class of BP-ideals of a BP-algebras as the underlying structure whence a certain uniformity and hence a topology is derived, which provides a natural connection between the concept of BP-algebras and the concept of topology. Thus a BP-algebra becomes a topological BP-algebra.

## 2. PRELIMINARIES :

**Definition 2.1 [1].** Let  $X$  be a set with a binary operation  $*$  and a constant  $0$ . Then  $(X, *, 0)$  is called a BP-algebra if it satisfies the following axioms.

1.  $x * x = 0$
2.  $x * (x * y) = y$
3.  $(x * z) * (y * z) = x * y$  for any  $x, y, z \in X$ .

**Proposition 2.2 [1].** If  $(X, *, 0)$  is a BP-algebra, then the following results are hold:

For any  $x, y \in X$

1.  $0 * (0 * x) = x$ .
2.  $x * (x * y) = y$ .
3.  $x * 0 = x$ .
4.  $x * y = 0$  implies  $y * x = 0$ .
5.  $0 * x = 0 * y$  implies  $x = y$ .
6.  $(x * z) * (y * z) = (x * y)$
7.  $0 * x = x$  implies  $x * y = y * x$

**Proposition 2.3 [1].** If  $(X, *, 0)$  is a BP-algebra with  $(x * y) * z = x * (z * y)$  for any  $x, y, z \in X$ , then  $0 * x = x$  for any  $x \in X$ .

**Theorem 2.4 [1].** If  $(X, *, 0)$  is a BP-algebra with  $x * y = 0$  and  $y * x = 0$ , then  $x = y$ .

**Definition 2.5 [4].** Let  $S$  be a non-empty subset of a BP-algebra  $X$ , then  $S$  is called BP-subalgebra of  $X$  if  $x * y \in S$  for all  $x, y \in S$ .

**Definition 2.6 [4].** Let  $(X, *, 0)$  be a BP-algebra and  $I$  be a non-empty subset of  $X$ . Then  $I$  is called an ideal of  $X$ , if it satisfies the following conditions.

1.  $0 \in I$ .
2.  $x * y \in I$  and  $y \in I \Rightarrow x \in I$ .

**Definition 2.7 [4].** Let  $(X, *, 0)$  be a BP-algebra and  $I$  be a non-empty subset of  $X$ . Then  $I$  is called a BP-ideal of  $X$  if it satisfies the following conditions:

1.  $0 \in I$ .
2.  $(x * y) * z \in I$  and  $y \in I \Rightarrow x * z \in I$ .

**Lemma 2.8 [4].** In a BP-algebra  $X$  any BP-ideal  $I$  is an ideal in  $X$ .

**Remark 2.9 [4].** Any BP-ideal of a BP-algebra is subalgebra, but converse is not true.

2. Any ideal of a BP-algebra is subalgebra, but converse is not true.

**Definition 2.10 [2].** Let  $X$  be a BP-algebra. An equivalence relation  $\sim$  on  $X$  is called a left congruence if  $x \sim y$  implies  $u * x \sim u * y$ , where  $x, y, u \in X$ .

An equivalence relation  $\sim$  on  $X$  is called a right congruence if  $x \sim y$  implies  $x * u \sim y * u$ , where  $x, y, u \in X$ .

**Definition 2.11[2].** Let  $X$  be a BP-algebra. An equivalence relation  $\sim$  on  $X$  is called a congruence if  $x \sim y, u \sim v$  imply  $x * u \sim y * v$ , where  $x, y, u, v \in X$ .

**Proposition 2.12[2].** Let  $X$  be a BP-algebra and  $\sim$  be an equivalence relation on  $X$ . Then  $\sim$  is congruence if and only if it is both a left congruence and a right congruence.

**Definition 2.13[2].** Let  $(X, *, 0)$  be a BP-algebra. We can define a binary relation " $\leq$ " by  $x \leq y$  if and only if  $x * y = 0$ , is called a BP-order on  $X$ . Then it is easy to show that  $\leq$  is a partial order on  $X$

**Theorem 2.14 [7].** Let  $X$  be a set and  $S \subseteq P(X \times X)$  be a family such that for every  $U \in S$  the following conditions hold:

- (a).  $\Delta \subseteq U$
- (b).  $U^{-1}$  contains a member of  $S$ .
- (c). there exists a  $V \in S$  such that  $V \circ V \subseteq U$ . Then there exists a unique uniformity  $u$ , for which  $S$  is a subbase.

### 3. UNIFORMITY ON BP-ALGEBRAS :

In this section we introduce the uniformity condition on BP-algebras with example and how it induces the topology on BP-algebras.

**Definition 3.1:** Let  $B$  be a BP-algebra and  $U$  and  $V$  be any subsets of  $B \times B$ . Define

$$X \circ Y = \{(a, b) \in B \times B / \text{for some } c \in B, (a, c) \in X \text{ and } (c, b) \in Y\},$$

$$X^{-1} = \{(a, b) \in B \times B / (b, a) \in X\},$$

$$\nabla = \{(a, a) / a \in B\}.$$

**Example 3.2:** Consider a BP-algebra  $(B = \{0, p, q, r\}, *, 0)$  with Cayley table

*	0	p	q	r
0	0	q	p	r
p	p	0	r	q
q	q	r	0	p
r	r	p	q	0

Let  $X = \{(0, 0), (q, 0)\}$  and  $Y = \{(0, r), (0, q)\}$

$$X \circ Y = \{(0, q), (0, r), (q, q), (q, r)\},$$

$$X^{-1} = \{(0, 0), (0, q)\},$$

$$\nabla = \{(0, 0), (p, p), (q, q)\}.$$

**Definition 3.3:** Let  $(B, *, 0)$  be a BP-algebra. A non-empty collection  $\mathbb{K}$  of subsets of  $B \times B$  is called uniformity on  $B$  if it satisfies the following axioms.

(U1)  $\nabla \subseteq X$  for any  $X \in \mathbb{K}$ ,

(U2) If  $X \in \mathbb{K}$ , then  $X^{-1} \in \mathbb{K}$ ,

(U3) If  $X \in \mathbb{K}$ , then there exist a  $Y \in \mathbb{K}$  such that  $Y \circ Y \subseteq X$ ,

(U4) If  $X, Y \in \mathbb{K}$ , then  $X \cap Y \in \mathbb{K}$ ,

(U5) If  $X \in \mathbb{K}$  and  $X \subseteq Y \subseteq B \times B$ , then  $Y \in \mathbb{K}$ .

The pair  $(B, \mathbb{K})$  is called a uniform structure.

**Example 3.4:** Let  $(B = \{p, 0\}, *, 0)$  be a BP-algebra.

$$\text{Define } \mathbb{K} = \{ \{(0, p), (p, p)\}, \{(0, 0), (p, p), (p, 0)\}, \{(0, 0), (p, p), (0, p)\}, \\ \{(0, 0), (p, p), (p, 0), (0, p)\} \}.$$

The pair  $(B, \mathbb{K})$  is a uniform structure.

**Theorem 3.5:** If  $I$  is an ideal of a BP-algebra  $B$ , then the relation defined on  $B$  by  $a \sim_I b$  if and only if  $a * b, b * a \in I$  is an equivalence relation on  $B$ .

**Proof:** Let  $I$  be an ideal of a BP-algebra  $B$ .

Reflexive:

Clearly the relation  $\sim_I$  is reflexive.

Symmetric:

Since  $a * a = 0$  and  $0 \in I$

If  $a \sim_I b$  implies  $a * b, b * a \in I$

$\Rightarrow b * a, a * b \in I \Rightarrow b \sim_I a$

The relation  $\sim_I$  is symmetric.

Transitive:

If  $a \sim_I b$  and  $b \sim_I c \Rightarrow a * b, b * a \in I$  and  $b * c, c * b \in I$ .

Since  $I$  is an ideal,  $(a * b) * (c * b) = (a * c) \in I$ . (By proposition 2.2(6))

Similarly  $(c * b) * (a * b) = (c * a) \in I$ .

Therefore the relation  $\sim_I$  is transitive. Hence the relation  $\sim_I$  is an equivalence relation.

**Definition 3.6:** Let  $(B, *, 0)$  be a BP-algebra, then the Congruence relation on  $B$  is an equivalence relation  $\cong$  on the elements of  $B$  satisfying  $h_1 \cong h_2$  and  $f_1 \cong f_2$

$$\Rightarrow h_1 * f_1 = h_2 * f_2 \text{ for all } h_1, h_2, f_1, f_2 \in B.$$

**Theorem 3.7:** Let  $B$  be a BP-algebra and  $I$  is an ideal on  $B$ , then the relation  $\sim_I$  is a Congruence relation on  $B$ .

**Proof.** From theorem 3.5, the relation  $\sim_I$  is an equivalence relation.

It is enough to prove that, if  $a \sim_I b$  and  $f \sim_I n$ , then  $a * f \sim_I b * n$ .

Since  $a \sim_I b$  and  $f \sim_I n$ , then  $a * b, b * a, f * n, n * f \in I$ .

To prove  $(a * f) * (b * n)$  and  $(b * n) * (a * f) \in I$ .

$$\begin{aligned} \text{Consider } ((a * f) * (b * n)) * (n * f) &= ((a * f) * (n * f)) * (b * n) \\ &= (a * n) * (b * n) \\ &= (a * b) \in I \quad (\text{By proposition}) \end{aligned}$$

Since  $I$  is an ideal in  $B$ ,  $(a * f) * (b * n) \in I$

Similarly, we can prove  $(b * n) * (a * f) \in I$

Hence the relation  $\sim_I$  is a Congruence relation on  $B$ .

**Theorem 3.8.** Let  $I$  be an ideal of a BP-algebra  $B$ .

We define  $X_I = \{(a, b) \in B \times B / a * b \in I \text{ and } b * a \in I\}$  and let  $\mathbb{K}^+ = \{U_I / I \text{ is an ideal of } B\}$ .

Then  $\mathbb{K}^+$  satisfies the axioms  $U_1$  to  $U_4$ .

**Proof.** [U1]. Let  $(a, a) \in \nabla$ , since  $a * a = 0 \in I$ ,  $(a * a) \in X_I$

Hence  $\nabla \subseteq X_I$  for any  $X_I \in \mathbb{K}^+$

[U2]. For any  $X_I \in \mathbb{K}^+$

$(a, b) \in X_I \Leftrightarrow a * b \in I \text{ and } b * a \in I$

$$\Leftrightarrow b \sim_I a$$

$$\Leftrightarrow (b, a) \in X_I$$

$$\Leftrightarrow (a, b) \in X_I^{-1}$$

Hence  $X_I^{-1} = X_I \in \mathbb{K}^+$

[U3]. For any  $X_I \in \mathbb{K}^+$ , the transitivity condition of  $\sim_I$  implies that  $X_I \circ X_I \subseteq X_I$

[U4]. For any  $X_M$  and  $X_N \in \mathbb{K}^+$

To prove  $X_M \cap X_N \in \mathbb{K}^+$

$(a, b) \in X_M \cap X_N \Leftrightarrow (a, b) \in X_M \text{ and } (a, b) \in X_N$

$$\Leftrightarrow a * b, b * a \in M \cap N$$

$$\Leftrightarrow a \sim_{M \cap N} b$$

$$\Leftrightarrow (a, b) \in X_{M \cap N}$$

Since  $M \cap N$  is an ideal of BP-algebra,  $X_M \cap X_N = X_{M \cap N} \in \mathbb{K}^+$

Hence the theorem.

**Theorem 3.9:** Let  $\mathbb{K} = \{X \subseteq B \times B / X_I \subseteq X \text{ for some } X_I \in \mathbb{K}^+\}$ . Then  $\mathbb{K}$  satisfies the axioms for a uniformity on BP-algebra  $B$  and hence the pair  $(B, \mathbb{K})$  is a uniform structure.

**Proof.** By theorem 3.8, the collection  $\mathbb{K}$  satisfies the axioms U1 to U4.

It is enough to prove that  $\mathbb{K}$  satisfies U5.

Let  $X \in \mathbb{K}$  and  $X \subseteq Y \subseteq B \times B$ , then there exist a  $X_I \subseteq X \subseteq Y$ .

This means that  $Y \in \mathbb{K}$ .

Hence the theorem.

**Notation 3.10:** Let  $B$  be a BP-algebra,  $a \in B$  and  $X \in \mathbb{K}$ .

Define  $X[a] = \{b \in B / (a, b) \in X\}$ .

**Theorem 3.11:** Let  $B$  be a BP-algebra. Then

$T = \{G \subseteq B / \forall a \in G, \text{ there exist } X \in \mathbb{K}, X[a] \subseteq G\}$  is a topology on  $B$

**Proof:** Since  $\emptyset$  and the set  $B$  belongs to  $T$ .

From the definition, clearly  $T$  is closed under arbitrary unions.

Finally we prove that  $T$  is closed under the finite intersection.

Let  $G, H$  belongs to  $T$  and suppose  $a \in G \cap H$ , then there exists  $X$  and  $Y \in \mathbb{K}$  such that  $X[a] \subseteq G$  and  $Y[a] \subseteq H$

Let  $U = X \cap Y$ , then  $U \in \mathbb{K}$

Also  $U[a] \subseteq X[a] \cap Y[a]$  and so  $U[a] \subseteq G \cap H$

Therefore  $G \cap H \in T$ .

Thus  $T$  is a topology of  $B$ .

Hence the theorem.

**Definition 3.12:** Let  $B$  be a BP-algebra. For any  $a \in B$ ,  $X[a]$  is an open neighborhood of  $a$ .

**Example 3.13:** Let  $B = \{0, p, q\}$  be a non-empty set and the collection

$\mathbb{K} = \{\{\nabla, (p, 0), (0, p), (0, q), (q, 0), (q, p)\}, \{\nabla, (p, 0), (0, p), (0, q), (q, 0), (p, q)\}\}$  is a uniform structure.

Define a topology  $T = \{B, \emptyset, \{p, 0\}, \{q\}\}$  (By using 3.9)

Then  $T$  is called the uniform topology on  $B$  induced by  $\mathbb{K}$

**Example 3.14:** Let  $B = \{0, p, q, r\}$  be a BP-algebra with the Cayley table given below.

*	0	p	q
0	0	q	p
p	p	0	q
q	q	p	0

It is easy to prove that  $A = \{0, P\}$ ,  $E = \{0, q\}$ ,  $D = \{0\}$  and  $B$  are the only ideals in  $B$ .

We can see that  $X_A = \nabla \cup \{(0, p), (p, 0)\}$

$X_E = \nabla \cup \{(q, 0), (0, q)\}$ ,  $X_D = \nabla$  and  $X_B = B \times B$

Therefore  $\mathbb{K}^+ = \{X_D, X_E, X_A, X_B\}$  and

$\mathbb{K} = \{X \subseteq B \times B / X_A \subseteq X \text{ for some } X_A \in \mathbb{K}^+\}$ .

If  $X = X_A$ , then  $X[0] = X[p] = \{0, p\}$

Therefore  $T = \{C \subseteq B, \forall a \in C, \text{ there exist } X \in \mathbb{K}, X[a] \subseteq C\} \supseteq \{B, \emptyset, \{q\}, \{0, p\}\}$ .

Since  $\{B, \emptyset, \{q\}, \{0, p\}\}$  is a topology on  $B$ , the topology  $T$  on  $B$  induced by an ideal.

$A = \{0, p\}$  relative to  $X_A$

Let  $A = \{0\}$ , then  $X[a] = \{a\} \forall a \in B$  and we define  $T = 2^a$ , the discrete topology

Moreover, if we consider  $B$  as an ideal of  $B$ , then  $X[a] = B$ , for all  $a \in B$  and

we get  $T = \{\emptyset, B\}$ , the indiscrete topology.  $a * b$

**Theorem 3.15:** Let  $I$  be a BP-ideal of a BP-algebra  $B$ . If we define a binary operation on the quotient set  $B/I = \{I_a / a \in B\}$  by  $I_a * I_b = I_{a*b}$ , then  $(B/I, *, I_0)$  is a BP-algebra called the Quotient algebra of  $B$  relative to  $I$ .

**Proof.** If  $I_a = I_{a_1}$  and  $I_b = I_{b_1}$ , then  $a \sim a^1$  and  $b \sim b^1$

Hence  $\sim$  is a congruence relation.

Therefore  $I_a * I_b = I_{a*b} = I_{a_1*b_1} = I_{a_1} * I_{b_1}$

Thus  $*$  is well defined on  $B/I$ .

Assume that  $I_a * I_b = I_b * I_a = I_0$ , then  $I_{a*b} = I_{b*a} = I_0$

Hence  $a * b \sim 0$  and  $b * a \sim 0$ .

Therefore  $(B/I, *, I_0)$  is a edge BP-algebra

By the proposition 2.2 (2) and (6), we have  $(B/I, *, I_0)$  is a BP-algebra.

#### 4. CONCLUSION:

S.S. Ahn and J.S. Han [1] introduced the concept of BP-algebras, which is generalization of B-algebras. In this paper we show that how to connect the topology concepts with BP-algebras.

#### Acknowledgement

The authors would like highly grateful to referees for their valuable suggestions and comments which improved the paper.

#### Competing Interests

The authors declare that they have no competing interests.

#### Authors Contribution

All the authors contributed significantly in writing this article. The authors read and approved the final manuscript.

**ABSTRACT:** Motivated by some results on  $(\alpha, \beta)$  – reverse derivations on prime and semiprime rings in [4]. The authors investigated some properties of  $(\alpha, \beta)$  – reverse derivations on prime and semiprime rings. The main results of that paper is if  $R$  is a prime ring of characteristic  $\neq 2$ ,  $(\alpha, \beta)$  - reverse derivation and generalized  $(\alpha, \beta)$  – reverse derivation are  $(\alpha, \beta)$  derivations and generalized  $(\alpha, \beta)$  derivations of  $R$ , respectively and also derived some necessary and sufficient condition for  $(\alpha, \beta)$  – reverse derivations exist. Now in this paper I also investigate same thing in prime and semiprime semiring.

**Keywords:** Semiring, Prime, Semiprime, Reverse Derivation, Generalized Reverse Derivation, Generalized  $(\alpha, \beta)$  – reverse derivation.

## 1. INTRODUCTION:

A Semiring  $(S, +, \cdot)$  is a non-empty set  $S$  together with two binary operations,  $+$  and  $\cdot$  such that, i)  $(S, +)$  is monoid and  $(S, \cdot)$  is semigroup ii) For all  $a, b, c \in S$ ,  $a \cdot (b + c) = a \cdot b + a \cdot c$  and  $(b + c) \cdot a = b \cdot a + c \cdot a$ . A semiring  $S$  is said to be  $n$  - torsion free if  $nx = 0 \Rightarrow x = 0, \forall x \in S$ . A semiring  $S$  is Prime if  $xSy = 0 \Rightarrow x = 0$  or  $y = 0, \forall x, y \in S$  and  $S$  is Semi Prime if  $x S x = 0 \Rightarrow x = 0, \forall x \in S$ .

For  $x, y \in S$ ,  $xy - yx$  is denoted by  $[x, y]$  and  $x\alpha(y) - \beta(y)x$  is denoted by  $[x, y]_{\alpha, \beta}$

An additive mapping  $d: S \rightarrow S$  is called a derivation if  $d(xy) = d(x)y + x d(y), \forall x, y \in S$ . For a fixed  $a \in S$ ,  $I_a: S \rightarrow S$  is given by  $I_a(x) = [a, x]$ , is called an inner derivation determined by  $a$ .

An additive mapping  $D: S \rightarrow S$  is called a generalized derivation if there exist a derivation  $d$  of  $S$  such that  $D(xy) = D(x)y + x d(y), for all x, y \in S$ .  $C_{\alpha, \beta} = \{c \in S / c\alpha(s) = \beta(s)c, for all s \in S\}$  is known as  $(\alpha, \beta)$  - center of  $S$ . An additive mapping  $d: S \rightarrow S$  is called an  $(\alpha, \beta)$  – derivation if  $d(xy) = d(x)\alpha(y) + \beta(x)d(y), for all x, y \in S$ . An additive mapping  $D: S \rightarrow S$  is said to be a generalized  $(\alpha, \beta)$  – derivation associated with  $(\alpha, \beta)$  – derivation  $d$  if  $D(xy) = D(x)\alpha(y) + \beta(x)d(y), for all x, y \in S$ . For fixed  $a \in S$ ,  $I_a: S \rightarrow S$  is given by  $I_a(x) = [a, x]_{\alpha, \beta}$  which is called  $(\alpha, \beta)$  – inner derivation determined by  $a$ .

Throughout this paper,  $S$  is a semiring,  $Z(S)$  is the center of  $S$ ,  $\alpha, \beta$  are homomorphisms of  $S$  and  $C_\alpha = \{c \in S / c\alpha(x) = \beta(x)c, for all x \in S\}$ . We use the basic commutator identities.

i)  $[x, yz] = y[x, z] + [x, y]z$  ii)  $[x, yz]_{\alpha, \beta} = [x, y]_{\alpha, \beta} \alpha(z) + \beta(y)[x, z]_{\alpha, \beta}$

The main result of this paper is for a semiprime semiring  $S$ , any  $(\alpha, \beta)$  – reverse derivation is a  $(\alpha, \beta)$  – derivation mapping  $S$  into the center. The another main result of this paper is , if  $S$  is a prime semiring,  $D$  is a non-zero  $(\alpha, \beta)$  – reverse derivation of  $S$ , then  $D$  is a  $(\alpha, \beta)$  – derivation of  $S$  and if  $D$  is a nonzero generalized  $(\alpha, \beta)$ - reverse derivation of  $S$ , then  $D$  is a generalized  $(\alpha, \beta)$  – derivation of  $S$ .

## 2. $(\alpha, \beta)$ – REVERSE DERIVATION ON PRIME SEMIRING

### Definition : 2.1

An additive mapping  $D : S \rightarrow S$  is said to be an  $(\alpha, \beta)$  – reverse derivation of  $S$  if  $D(xy) = D(y)\alpha(x) + \beta(y)D(x), \forall x, y \in S$ .

### Definition : 2.2

Let  $d$  be a  $(\alpha, \beta)$  – reverse derivation. An additive mapping  $D : S \rightarrow S$  is said to be a generalized  $(\alpha, \beta)$  – reverse derivation associated with  $d$  if  $D(xy) = D(y)\alpha(x) + \beta(y) d(x), \forall x, y \in S$

### Theorem : 2.3

Let  $S$  be a prime semiring and  $\beta$  be a automorphisms of  $S$ . A mapping  $D$  on  $S$  is a non-zero  $(\alpha, \beta)$  – reverse derivation of  $S$  iff  $S$  is commutative and  $D$  is an ordinary  $(\alpha, \beta)$  – derivation of  $S$ .

### Proof:

Let  $S$  be a prime semiring and  $\alpha, \beta$  be a automorphisms of  $S$ .

Assume that  $D$  is a  $(\alpha, \beta)$  – reverse derivation of  $S$ .

$$\begin{aligned} \text{Let } x, y, z \in S. \text{ Then } D(x(yz)) &= D(yz)\alpha(x) + \beta(yz)D(x) \\ &= D(z)\alpha(y)\alpha(x) + \beta(z)D(y)\alpha(x) + \beta(y)\beta(z)D(x) \text{ -----(1)} \end{aligned}$$

$$\text{Also } D((xy)z) = D(z)\alpha(x)\alpha(y) + \beta(z)D(y)\alpha(x) + \beta(z)\beta(y)D(x) \text{ -----(2)}$$

$$\text{From (1) and (2), we get } D(z)\alpha([x, y]) + \beta([z, y])D(x) = 0 \text{ -----(3)}$$

$$\text{Put } y = x, \beta([z, x])D(x) = 0, \forall x, z \in S \text{ -----(4)}$$

Replace  $z$  by  $zy$  in (4),  $\beta(z)\beta([y, x])D(x) + \beta([z, x])\beta(y)D(x) = 0$

Using (4), we get  $\beta([z, x])\beta(y)D(x) = 0, \forall x, y, z \in S$

Since  $S$  is prime,  $x \in Z(S)$  or  $D(x) = 0, \forall x \in S$

Let  $A = \{x \in S/x \in Z(S)\}$  and  $B = \{x \in S/D(x) = 0\}$ . Clearly  $A$  and  $B$  are additive subgroups of  $S$  such that  $S = A \cup B$ . We know that the union of subgroups is subgroup iff one is contained in the other. Therefore  $S = A$  or  $S = B$ .

If  $S = B$ , then  $D = 0$ .

$\Rightarrow$  to our assumption

$\therefore S = A$

So  $S$  is commutative,  $D(xy) = D(yx) = D(x)\alpha(y) + \beta(x)D(y)$

Hence  $D$  is an  $(\alpha, \beta)$ - derivation.

**Example: 1** Consider the Semiring  $M_2(S) = \left\{ \begin{pmatrix} a & 0 \\ b & a \end{pmatrix} / a, b \in S \right\}$ . Define  $D : S \rightarrow S$  by  $D(x) =$

$$\begin{pmatrix} 0 & 0 \\ b & 0 \end{pmatrix}, \alpha(x) = \begin{pmatrix} a & 0 \\ b & a \end{pmatrix}, \beta(x) = \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix}, \forall x \in M_2(S).$$

It is easy to verify that  $D$  is  $(\alpha, \beta)$  – reverse derivation and ordinary  $(\alpha, \beta)$  – derivaton.

**Example : 2**

Consider the Semiring  $M_2(S) = \left\{ \begin{pmatrix} a & 0 \\ b & c \end{pmatrix} / a, b \in S \right\}$ . Define  $D: S \rightarrow S$  by  $D(x) = \begin{pmatrix} 0 & 0 \\ b & 0 \end{pmatrix}$ ,  $\alpha(x) = \begin{pmatrix} c & 0 \\ b & a \end{pmatrix}$ ,  $\beta(x) = \begin{pmatrix} a & 0 \\ 0 & c \end{pmatrix}$ ,  $\forall x \in M_2(S)$ .

It is easy to verify that D is neither  $(\alpha, \beta)$  – reverse derivation nor ordinary  $(\alpha, \beta)$  – derivaton.

**Theorem : 2.4**

Let S be a prime semiring and  $\beta$  be automorphisms of S. A mapping D is a non-zero generalized  $(\alpha, \beta)$ -reverse derivation with  $(\alpha, \beta)$ -reverse derivation d of S iff S is commutative and D is an ordinary generalized  $(\alpha, \beta)$  – derivation with a  $(\alpha, \beta)$  – derivation d of S.

**Proof:**

Let D be a non-zero generalized  $(\alpha, \beta)$ -reverse derivation with  $(\alpha, \beta)$ -reverse derivation d of S. Since d is a  $(\alpha, \beta)$ -reverse derivation, by previous theorem, S is commutative and d is a  $(\alpha, \beta)$ -derivation.

Since S is commutative ,  $D(xy) = D(yx) = D(x)\alpha(y) + \beta(x)d(y)$ ,  $\forall x, y \in S$

$\therefore$  D is an ordinary generalized  $(\alpha, \beta)$  – derivation of S with  $(\alpha, \beta)$  – derivation d of S.

**3.  $(\alpha, \beta)$  – REVERSE DERIVATION ON SEMIPRIME SEMIRING****Lemma: 3.1**

Let S be a 2-torsionfree semiprime semiring,  $s \in S$ ,  $\alpha, \beta$  be epimorphisms of S and  $D: S \rightarrow S$  such that  $D(x) = s\alpha(x) + \beta(x)s$ . If D is a  $(\alpha, \beta)$  – reverse derivation of S then  $D = 0$  and  $s = 0$ .

**Proof:**

Let S be a 2-torsionfree semiprime semiring,  $s \in S$ ,  $\alpha, \beta$  be epimorphisms of S and  $D: S \rightarrow S$  such that  $D(x) = s\alpha(x) + \beta(x)s$ .

For any  $x, y \in S$ ,  $D(xy) = s\alpha(xy) + \beta(xy)s$

$$\begin{aligned} \text{On the other hand, } D(xy) &= D(y)\alpha(x) + \beta(y)D(x) \\ &= s\alpha(y)\alpha(x) + \beta(y)s\alpha(x) + \beta(y)s\alpha(x) + \beta(y)\beta(x)s \\ &= s\alpha(yx) + 2\beta(y)s\alpha(x) + \beta(yx)s \\ &= D(yx) + 2\beta(y)s\alpha(x) \end{aligned}$$

$$\therefore D([x, y]) = 2\beta(y)s\alpha(x), \forall x, y \in S \quad \text{----- (5)}$$

Similarly,  $D([y, x]) = 2\beta(x)s\alpha(y)$ ,  $\forall x, y \in S$

Since  $D([x, y]) + D([y, x]) = 0$ ,  $2[\beta(y)s\alpha(x) + \beta(x)s\alpha(y)] = 0$

$$\text{Since S is 2- torsion free , } \beta(x)s\alpha(y) + \beta(y)s\alpha(x) = 0 \quad \text{----- (6)}$$

$$\begin{aligned} \text{Replacing y by yz , } \quad &\beta(x)s\alpha(yz) + \beta(yz)s\alpha(x) = 0 \\ &\beta(x)s\alpha(y)\alpha(z) + \beta(y)\beta(z)s\alpha(x) = 0 \\ &\beta(x)s\alpha(x)\alpha(z) + \beta(x)\beta(z)s\alpha(x) = 0 \\ &\beta(x)[s\alpha(x)\alpha(z) + \beta(z)s\alpha(x)] = 0 \end{aligned}$$

Since S is semiprime,  $s\alpha(x)\alpha(z) + \beta(z)s\alpha(x) = 0$

$$\begin{aligned} [s\alpha(z) + \beta(z)s]\alpha(x) &= 0 \\ s\alpha(z) + \beta(z)s &= 0, \forall z \in S \end{aligned}$$

ie,  $D = 0$ . (5) gives,  $2\beta(y)s\alpha(x) = 0, \forall x, y \in S$

Since S is 2-torsionfree semiprime semiring,  $c = 0$ .

**Lemma : 3.2**

Let  $S$  be a semiring,  $a, b \in S$ ,  $\alpha, \beta$  be mappings of  $S$  and  $D(x) = a\alpha(x) + \beta(x)b$ : If  $D$  is a  $(\alpha, \beta)$  –reverse derivation of  $S$  then the equality  $a(\alpha(xy) - \alpha(y)\alpha(x)) + \beta(xy) - \beta(y)\beta(x))b = \beta(y)(b + a)\alpha(x)$  is satisfied.

**Proof:**

For any  $x, y \in S, D(xy) = a\alpha(xy) + \beta(xy)b$

Since  $D$  is  $(\alpha, \beta)$  –reverse derivation of  $S$ ,

$$D(xy) = D(y)\alpha(x) + \beta(y)D(x) \\ = a\alpha(y)\alpha(x) + \beta(y)b\alpha(x) + \beta(y)a\alpha(x) + \beta(y)\beta(x)b$$

$$a\alpha(xy) + \beta(xy)b = a\alpha(y)\alpha(x) + \beta(y)b\alpha(x) + \beta(y)a\alpha(x) + \beta(y)\beta(x)b$$

$$\therefore a(\alpha(xy) - \alpha(y)\alpha(x)) + \beta(xy) - \beta(y)\beta(x))b = \beta(y)(b + a)\alpha(x)$$

**Theorem : 3.3**

Let  $S$  be a 2-torsionfree semiprime semiring,  $a, b \in S$ ,  $\alpha$  be epimorphism of  $S$ ,  $\beta$  be automorphism of  $S$  and  $D: S \rightarrow S, \exists D(x) = a\alpha(x) + \beta(x)b$ . If  $D$  is a non-zero  $(\alpha, \beta)$  – reverse derivation of  $S$  then  $D$  is ordinary inner  $(\alpha, \beta)$  – derivation of  $S$  which is determined by  $a$ .

**Proof**

For any  $x, y \in S, D(xy) = a\alpha(xy) + \beta(xy)b$

$$D(yx) = a\alpha(yx) + \beta(yx)b$$

Using Lemma 3.2,

$$\therefore D[x, y] = a(\alpha(xy) - \alpha(y)\alpha(x)) + \beta(xy) - \beta(y)\beta(x))b = \beta(y)(b + a)\alpha(x)$$

Similarly,  $D[y, x] = \beta(x)(b + a)\alpha(y), \forall x, y \in S$

$$D([x, y]) + D([y, x]) = 0$$

$$\beta(x)(b + a)\alpha(y) + \beta(y)(b + a)\alpha(x) = 0 \tag{7}$$

Replacing  $y$  by  $yz$ ,  $\beta(x)(b + a)\alpha(y)\alpha(z) + \beta(y)\beta(z)(b + a)\alpha(x) = 0$

$$\beta(x)(b + a)\alpha(x)\alpha(z) + \beta(x)\beta(z)(b + a)\alpha(x) = 0$$

$$\beta(x)[(b + a)\alpha(z) + \beta(z)(b + a)]\alpha(x) = 0$$

Since  $\alpha, \beta$  are epimorphism and  $S$  is Semiprime, we get,

$$(b + a)\alpha(z) + \beta(z)(b + a) = 0, \forall z \in S$$

$$\beta(y)(b + a) + (b + a)\alpha(y) = 0 \tag{8}$$

$$(7) \text{ implies, } -\beta(x)\beta(y)(b + a) - \beta(y)\beta(x)(b + a) = 0$$

$$\beta(xy + yx)(b + a) = 0, \forall x, y \in S \tag{9}$$

Replace  $y$  by  $yz$  and use the equation  $x(yz) + (yz)x = y(xz + zx) + [x, y]z$

$$\beta(y(xz + zx) + [x, y]z)(b + a) = 0, \forall x, y, z \in S$$

Putting  $z = \beta^{-1}(b + a)z[x, y]$ ,

$$\beta([x, y])(b + a)\beta(z)\beta([x, y]) = 0$$

$$\text{Since } S \text{ is semiprime, } \beta([x, y])(b + a) = 0 \tag{10}$$

From (9) and (10),  $2\beta(xy)(b + a) = 0, \forall x, y \in S$

Since  $S$  is 2-torsion free semiprime semiring,  $(b+a) = 0$

$$D(x) = a\alpha(x) - \beta(x)a = [a, x]_{\alpha, \beta}$$

Hence  $D$  is ordinary inner  $(\alpha, \beta)$  – derivation of  $S$  determined by  $a$ .

**Theorem : 3.4**

Let  $S$  be a 2-torsionfree semiprime semiring,  $a, b \in S$ ,  $\alpha$  be anti-epimorphisms of  $S$ ,  $\beta$  be anti automorphisms of  $S$  and  $D(x) = a\alpha(x) + \beta(x)b$ . If  $D$  is a non-zero  $(\alpha, \beta)$ -reverse derivation of  $S$  then  $D$  is ordinary inner  $(\alpha, \beta)$ - derivation of  $S$  which is determined by  $a$ .

**Proof:**

By lemma 3.2, and  $(\alpha, \beta)$  are anti-homomorphisms,  $\beta(y)(b + a)\alpha(x) = 0, \forall x, y \in S$

Since  $S$  is Semiprime semiring,  $b + a = 0$ , using hypothesis,  $D(x) = [a, x]_{\alpha, \beta}$

Hence  $D$  is ordinary inner  $(\alpha, \beta)$  – derivation of  $S$  determined by  $a$ .

**Theorem : 3.5**

Let  $S$  be a semiprime semiring,  $\alpha, \beta$  be a automorphisms and  $D$  and  $G$  be  $(\alpha, \beta)$  – reverse derivations of  $S$  such that,  $D(x)\alpha(y) + \beta(y)G(x) = 0, \forall x, y \in S$ . Then  $D(y)\alpha([z, x]) = \beta([z, x])G(y) = 0, \forall x, y, z \in S$ , in particular,  $D$  and  $G$  map  $Z(S)$ .

**Proof**

$$\text{Let } D(x)\alpha(y) + \beta(y)G(x) = 0, \forall x, y \in S \tag{11}$$

$$\text{Put } x = xy, D(xy)\alpha(y) + \beta(y)G(xy) = 0, \forall x, y \in S$$

Using  $(\alpha, \beta)$  – reverse derivations and (11), we get

$$\begin{aligned} D(x)\alpha(xy) + \beta(y)G(y)\alpha(x) &= 0, \forall x, y \in S \\ D(x)\alpha(xy) + \beta(y)G(y)\alpha(x) &= D(y)\alpha(xy) - D(y)\alpha(y)\alpha(x) = 0 \\ D(y)\alpha([x, y]) &= 0, \forall x, y \in S \end{aligned} \tag{12}$$

$$\text{Put } x = \alpha^{-1}(z)x,$$

$$D(y)z\alpha([x, y]) = 0, \forall x, y, z \in S \tag{13}$$

$$\begin{aligned} \text{Linearizing (12), } 0 &= D(y+z)\alpha([x, y+z]) \\ &= D(y)\alpha([x, y]) + D(y)\alpha([x, z]) + D(z)\alpha([x, y]) + D(z)\alpha([x, z]) \\ &= D(y)\alpha([x, z]) + D(z)\alpha([x, y]) \end{aligned}$$

$$\text{Hence, } D(z)\alpha([x, y]) = D(y)\alpha([z, x]), \forall x, y, z \in S$$

Now to prove  $D(y)\alpha([z, x]) = 0$

Consider  $D(y)\alpha([z, x])sD(y)\alpha([z, x]), \forall s \in S$

$$D(y)\alpha([z, x])sD(y)\alpha([z, x]) = D(y)\alpha([z, x])sD(z)\alpha([x, y])$$

Put  $t = \alpha([z, x])sD(z)$ , we get,

$$\begin{aligned} D(y)\alpha([z, x])sD(y)\alpha([z, x]) &= D(y)t\alpha([x, y]) \\ &= 0 \quad [\text{since by (13)}] \end{aligned}$$

$$\text{Hence } D(y)\alpha([x, y]) = 0, \forall x, y \in S \tag{A}$$

Next to show that  $D(S) \subseteq Z(S)$

$$\text{Replacing } z \text{ by } z\alpha^{-1}(D(y)) \text{ in (A), } D(y)\alpha(z)[D(y), \alpha(x)] = 0, \forall x, y, z \in S \tag{14}$$

$$\text{Put } z = xz, D(y)\alpha(x)\alpha(z)[D(y), \alpha(x)] = 0, \forall x, y, z \in S$$

$$\text{Multiply } \alpha(x) \text{ in (14), } \alpha(x)D(y)\alpha(z)[D(y), \alpha(x)] = 0 \tag{15}$$

$$\text{Subtract (14) and (15), } [D(y), \alpha(x)]\alpha(z)[D(y), \alpha(x)] = 0$$

Since  $S$  is Semiprime,  $[D(y), \alpha(x)] = 0, \forall x, y \in S$

Hence  $D(S) \subseteq Z(S)$

Similarly to prove,  $\beta([z, x])G(y) = 0, \forall x, y, z \in S$  and  $G(S) \subseteq Z(S)$

**ABSTRACT:** *In this paper, we introduce generalization of generalized star closed sets  $((gg)^*$ -closed sets) and generalized  $\omega$ -closed sets in topological spaces .*

**Keywords:** *Closed sets, Generalized closed set,  $(gg)^*$ -closed sets,  $g\omega$ -open,  $g\omega$ -closed sets.*

## 1. INTRODUCTION:

Closed sets are basic objects in a topological space. In 1970, N. Levine [3] initiated the study of  $g$ -closed sets . By Definition, a subset  $S$  of a topological space  $X$  is called generalized closed if  $clA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open. Generalized closed sets also proffer new properties of topological spaces and mainly are separation axioms weaker than  $T_1$ . In [1], Aull and Thron introduce several separation axioms between  $T_0$  and  $T_1$ . Furthermore, the study of generalized closed sets also provide new characterization of some known classes of spaces for example the class of extremely disconnected spaces. Other new properties are defined by variations of the property of submaximality. In Section 2 , we follow a similar line to introduce generalized  $\omega$ - closed sets by utilizing the  $\omega$ -closure operator. We study  $g$ -closed sets and  $g\omega$ -closed sets in the spaces  $(X, \tau)$  and  $(X, \tau_\omega)$ . In particular, we show that a subset  $A$  of a space  $(X, \tau)$  is closed in  $(X, \tau_\omega)$  if and only if it is  $g$ -closed in  $(X, \tau_\omega)$  if and only if it is  $g\omega$ -closed in  $(X, \tau_\omega)$ .

## 2. PRELIMINARIES

Throughout this paper  $(X, \tau)$  denotes the topological space with no separation properties assumed. For a subset  $A$  of  $X$  , the closure of  $A$  and interior of  $A$  are denoted by  $cl(A)$  and  $int(A)$  respectively. A subset  $A$  of a topological space  $X$  is called  $\alpha$ -open [resp. semi-open, preopen, semi-preopen] if  $A \subseteq int(cl(int A))$  [resp.  $A \subseteq cl(int A)$ ,  $A \subseteq int(cl A)$ ,  $A \subseteq cl(int(cl A))$ ]. Moreover,  $A$  is said to be  $\alpha$ -closed [resp. semi-closed, preclosed, semi-preclosed ] if  $X/A$  is  $\alpha$ -open [resp. semi-open, preopen, semi-preopen] or, equivalently, if  $cl(int(cl A)) \subseteq A$  [resp.  $int(cl A) \subseteq A$ ,  $cl(int A) \subseteq A$ ,  $int(cl(int A)) \subseteq A$ ].

Let  $(X, \tau)$  be a topological space and let  $A$  be a subset of  $X$ . The closure of  $A$ , the

interior of  $A$ , and the relative topology on  $A$  will be denoted by  $cl_\tau(A)$ ,  $int_\tau(A)$ , and  $\tau_A$ , respectively. The  $\omega$ -interior ( $\omega$ -closure) of a subset  $A$  of a space  $(X, \tau)$  is the interior (closure) of  $A$  in the space  $(X, \tau_\omega)$ , and is denoted by  $int_{\tau_\omega}(A)$  ( $cl_{\tau_\omega}(A)$ ).

**Definition 2.1.** A space  $(X, \tau)$  is called

- (a) locally countable [4] if each point  $x \in X$  has a countable open neighborhood;
- (b) anti-locally countable [2] if each nonempty open set is uncountable;
- (c)  $T_{1/2}$ -space [10] if every  $g$ -closed set is closed (equivalently if every singleton is open or closed, see [30]).

**Definition 2.2.** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called

- (a)  $g$ -continuous [5] if  $f^{-1}(V)$  is  $g$ -closed in  $(X, \tau)$  for every closed set  $V$  of  $(Y, \sigma)$ ;
- (b)  $g$ -irresolute [5] if  $f^{-1}(V)$  is  $g$ -closed in  $(X, \tau)$  for every  $g$ -closed set  $V$  of  $(Y, \sigma)$ ;
- (c)  $\omega$ -continuous [11] if  $f^{-1}(V)$  is  $\omega$ -open in  $(X, \tau)$  for every open set  $V$  of  $(Y, \sigma)$ ;
- (d)  $\omega$ -irresolute [12] if  $f^{-1}(V)$  is  $\omega$ -open in  $(X, \tau)$  for every  $\omega$ -open set  $V$  of  $(Y, \sigma)$ ;
- (e)  $\alpha$ -continuous [31] if  $f^{-1}(V)$  is  $\alpha$ -set in  $(X, \tau)$  for every open set  $V$  of  $(Y, \sigma)$ .

**Lemma 2.3** .[4] *Let  $A$  be a subset of a space  $(X, \tau)$ . Then,*

- (a)  $(\tau_\omega)_\omega = \tau_\omega$ ; (b)  $(\tau_A)_\omega = (\tau_\omega)^A$ .

**Definition 2.4.**

- (1) generalized closed set ( $g$ -closed) [3] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (2) Semi generalized closed [6] if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is Semi open in  $X$ .
- (3) generalized semi closed [8] if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (4) generalized  $\alpha$ -closed ( $g\alpha$ -closed)[7] if  $\alpha-cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $X$ .
- (5)  $\alpha$  generalized closed ( $\alpha$   $g$ -closed) [9] if  $\alpha-cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (6) generalized semi pre closed ( $gsp$ -closed)[13] if  $spcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (7) generalized pre closed ( $gp$ -closed)[14] if  $pcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (8) regular semi-open[15] if there is a regular open set  $U$  such that  $U \subseteq A \subseteq cl(U)$ .
- (9) regular open set[16] if  $A = int(cl(A))$ .
- (10) regular closed set if  $A = cl(int(A))$ .
- (11)  $t$ -set [17] iff  $int(A) = int(cl(A))$ .
- (12) regular generalized closed set ( $rg$ -closed)[18]if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular open in  $X$ .
- (13)generalized pre-regular closed ( $gpr$ -closed)[19] if  $pcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular open in  $X$ .
- (14) generalized semi-pre regular closed ( $gspr$ -closed)[20]if  $spcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular open in  $X$ .

(15) generalized star pre closed (g\*p-closed)[21] if  $pcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is g-open in  $X$ .

(16) regular generalized  $\alpha$ -closed (rg $\alpha$ -closed)[22] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular  $\alpha$ -open in  $X$ .

(17) generalized  $\alpha$ -closed (g $\alpha$ -closed)[23] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $X$ .

(18) generalization of generalized closed set (gg-closed)[24] if  $gcl(A) \subseteq U$  whenever and  $U$  is regular semi open in  $X$ .

(19) A topological space  $X$  is said to be locally indiscrete if every open subset is closed.

(20) R\*-closed set [25] if  $rcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular semi open in  $X$ .

**Definition 2.5.** [27] A space  $X$  is said to be submaximal if every dense subset of  $X$  is open. A Space  $X$  is  $\alpha$ -sub maximality (resp. g-submaximal, sg-submaximal) if every dense subset is  $\alpha$ -open (resp g-open, sg-open)[26]. Obviously every submaximal space is g-submaximal, that if  $(X, \alpha(X))$  is g-submaximal, then  $(X, \alpha(X))$  is also sg-submaxima.

**Remark 2.6.** [28]. Every semi-preclosed set is sg-closed and every preclosed set is g $\alpha$ -closed.

**Definition 2.7.** Let  $S$  be a subset of a space  $X$ . A resolution of  $S$  is a pair  $\langle E_1, E_2 \rangle$  of disjoint dense subsets of  $S$ . The subset  $S$  is said to be resolvable if it possesses a resolution, otherwise  $S$  is said to be irresolvable.

**Definition 2.8.** Let  $S$  ne a subset of a space  $X$ , then  $S$  is called strongly irresolvable, if every open subspace of  $S$  is irresolvable.

**Remark 2.9.** If  $\langle E_1, E_2 \rangle$  is a resolution of  $S$  then  $E_1$  and  $E_2$  are condense in  $X$  .i.e. have empty interior.

**Lemma 2.10** [29] Every space  $X$  has a unique decomposition  $X = F \cup G$  where  $F$  is closed and resolvable and  $G$  is open and hereditarily irresolvable. This decomposition is called Hewitt decomposition of  $X$ .

**Theorem 2.11.** [32] For a space  $X$  with Hewitt decomposition  $X = F \cup G$ . Then the following are equivalent.

(1) every semi-preclosed subset of  $X$  is sg-closed set.

(2)  $X_1 \cap sclA \subseteq spclA$  for each  $A \subseteq X_1$

(3).  $X_1 \subseteq \text{int}(clG)$

(4)  $X \approx Y \oplus Z$ , where  $Y$  is locally indiscrete and  $Z$  is strongly irresolvable.

(5) every preclosed subset of  $X$  is g $\alpha$ -closed

(6)  $X$  is g-submaximal with respect to  $\alpha(X)$ .

### 3.(gg)\*-CLOSED SETS

**Definition 3.1.** A subset  $A$  of a topological space  $(X, \tau)$  is called generalization of generalized star closed sets (gg)\*-closed if  $rcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is gg-open.

**Proposition 3.2.** Every regular closed set is (gg)\*-closed.

Proof: Let  $A$  be a regular closed set in  $X$  such that  $A \subseteq U$  and  $U$  is gg-open.

Then  $rcl(A) \subseteq U$ . Therefore  $A$  is  $(gg)^*$ -closed.

**Proposition 3.3.** Every  $(gg)^*$ -closed set is  $g$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $cl(A) \subseteq rcl(A) \subseteq U$  Hence  $A$  is  $g$ -closed

**Proposition 3.4.** Every  $(gg)^*$ -closed set is  $gsp$ -closed

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $spcl(A) \subseteq rcl(A) \subseteq U$  Hence  $A$  is  $gsp$ -closed.

**Proposition 3.5.** Every  $(gg)^*$ -closed set is  $gp$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $pcl(A) \subseteq rcl(A) \subseteq U$  Hence  $A$  is  $gp$ -closed.

**Proposition 3.6.** Every  $(gg)^*$ -closed set is  $gs$ -closed.

**Proof :** Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed  $rcl(A) \subseteq U$ .

But we have  $scl(A) \subseteq rcl(A) \subseteq U$ . Hence  $A$  is  $gs$ -closed.

**Proposition 3.7.** Every  $(gg)^*$ -closed set is  $\alpha g$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed  $rcl(A) \subseteq U$ .

But we have  $\alpha cl(A) \subseteq rcl(A) \subseteq U$ . Hence  $A$  is  $\alpha g$ -closed.

**Proposition 3.8.** Every  $(gg)^*$ -closed set is  $rg$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every regular open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $cl(A) \subseteq rcl(A) \subseteq U$ . Hence  $A$  is  $rg$ -closed.

**Proposition 3.9.** Every  $(gg)^*$ -closed set is  $gpr$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be an open set in  $X$  such that  $A \subseteq U$

Since every regular open set is  $gg$ -open[24] and  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $pcl(A) \subseteq rcl(A) \subseteq U$ .

Hence  $A$  is  $gpr$ -closed.

**Proposition 3.10.** Every  $(gg)^*$ -closed set is  $gspr$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be a regular open set in  $X$  such that

$A \subseteq U$ .

Since every regular open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $spcl(A) \subseteq rcl(A) \subseteq U$

Hence  $A$  is  $gspr$ -closed.

**Proposition 3.11.** Every  $(gg)^*$ -closed set is  $g^*p$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be a regular open set in  $X$  such that

$A \subseteq U$ .

Since every  $g$ -open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$  But we

have  $pcl(A) \subseteq rcl(A) \subseteq U$

Hence  $A$  is  $g^*p$ -closed.

**Proposition 3.12.** Every  $(gg)^*$ -closed set is  $g^{**}$ -closed.

Proof: Let  $A$  be a  $(gg)^*$ -closed set in  $X$ . Let  $U$  be a  $g^*$ -open set in  $X$  such that  $A \subseteq U$

Since every  $g^*$ -open set is  $gg$ -open[24] and since  $A$  is  $(gg)^*$ -closed,  $rcl(A) \subseteq U$ .

But we have  $cl(A) \subseteq rcl(A) \subseteq U$ .

Hence  $A$  is  $g^{**}$ -closed.

#### 4. GENERALIZED $\omega$ -CLOSED SETS :

**Definition 4.1.** A subset  $A$  of a space  $(X, \tau)$  is called generalized  $\omega$ -closed (briefly,  $g\omega$ -closed) if  $cl_{\tau_\omega}(A) \subseteq U$  whenever  $U \in \tau$  and  $A \subseteq U$

We denote the family of all generalized  $\omega$ -closed (generalized closed) subsets of a space  $(X, \tau)$  by  $G\omega C(X, \tau)(GC(X, \tau))$ .

It is clear that if  $(X, \tau)$  is a countable space, then  $G\omega C(X, \tau) = P(X)$ , where  $P(X)$  is the power set of  $X$ .

**Proposition 4.2.** Every  $g$ -closed set is  $g\omega$ -closed.

The proof follows immediately from the definitions and the fact that  $\tau_\omega$  is finer than  $\tau$  for any space  $(X, \tau)$ . However, the converse is not true in general as the following example shows.

**Example 4.3.** Let  $X = \{a, b, c\}$  with the topology  $\tau = \{\emptyset, X, \{a\}, \{a, b\}\}$  and let  $A = \{a\}$ .

Then  $A \in G\omega C(X, \tau)$ . But  $A \notin GC(X, \tau)$  since  $A \subseteq A \in \tau$  and  $cl_\tau(A) = X \not\subseteq A$ .

**Lemma 4.4.** Let  $(A, \tau_A)$  be an anti-locally countable subspace of a space  $(X, \tau)$ .

Then  $cl_\tau(A) = cl_{\tau_\omega}(A)$ .

*Proof.* We need to prove that  $cl_\tau(A) \subseteq cl_{\tau_\omega}(A)$ . Suppose that there exists

$x \in cl_\tau(A) - cl_{\tau_\omega}(A)$ . Then  $x \notin cl_{\tau_\omega}(A)$ , and so there exists  $W_x \in \tau_\omega$  such that  $x \in W_x$  and

$W_x \cap A = \emptyset$ .  $A$  is a nonempty countable open set in  $(A, \tau_A)$ , which is a contradiction and the result follows.

**Corollary 4.5.** Let  $(A, \tau_A)$  be an anti-locally countable subspace of a space  $(X, \tau)$ . Then  $A \in GC(X, \tau)$  if and only if  $A \in G\omega C(X, \tau)$ .

**Theorem 4.6.** Let  $(X, \tau)$  be any space and  $A \subseteq X$ . Then the following are equivalent.

1)  $A$  is  $\omega$ -closed in  $(X, \tau)$  (equivalently  $A$  is closed in  $(X, \tau_\omega)$ ).

2)  $A \in GC(X, \tau_\omega)$

3)  $A \in G\omega C(X, \tau_\omega)$

1)Proof. (a) $\Rightarrow$ (b). It follows from the fact that every closed set is  $g$ -closed.

(b) $\Rightarrow$ (c). It is obvious by using Proposition 4.2.

(c) $\Rightarrow$ (a). We show that  $cl_{\tau_\omega}(A) \subseteq A$ . Suppose that  $x_0 \notin A$ . Then  $U = X - \{x_0\}$  is an  $\omega$ -open set containing  $A$ . Since  $A \in G\omega C(X, \tau_\omega)$ ,  $cl_{(\tau_\omega)\omega}(A) = cl_{\tau_\omega}(A) \subseteq U$ , and thus  $x_0 \notin cl_{\tau_\omega}(A)$ . Therefore,  $cl_{\tau_\omega}(A) \subseteq A$ , that is,  $A$  is closed in  $(X, \tau)$ .

In the same way, it can be shown that a subset  $A$  of a space

$(X, \tau)$  is closed if and only if  $cl_\tau(A) \subseteq U$  whenever  $U \in \tau_\omega$  and  $A \subseteq U$ .

**Proposition 4.7.** If  $A \in GC(X, \tau_\omega)$ , then  $A \in G\omega C(X, \tau)$  but not conversely.

**Example 4.8.** Let  $X = \mathbf{R}$  be the set of all real numbers with the topology  $\tau = \{\emptyset, X, \{1\}\}$  and put  $A = \mathbf{R} - \mathbf{Q}$ . Then  $A$  is an  $\omega$ -open subset of  $(X, \tau)$  such that  $cl_{\tau_\omega}(A) = \mathbf{R} - \{1\} \not\subseteq A$  (i.e.,  $A \notin GC(X, \tau_\omega)$ ). However,  $A \in G\omega C(X, \tau)$  since the only open set in  $(X, \tau)$  containing  $A$  is  $X$ .

In Example 4.8, for a space  $(X, \tau)$  the collections  $GC(X, \tau)$  and  $GC(X, \tau_\omega)$  are independent from each other.

**Example 4.9.** Consider  $X = \mathbf{R}$  with the usual topology  $\tau_u$ . Put  $A = (0,1) \cap \mathbf{Q}$ . Then  $cl_{(\tau_u)\omega}(A) = A$  ( $A$  is countable), and so  $A \in GC(\mathbf{R}, (\tau_u)\omega)$ . On

the other hand,  $A \notin GC(\mathbf{R}, \tau_u)$  since  $U = (0,1)$  is open in  $(\mathbf{R}, \tau_u)$  such that  $A \subseteq U$  and  $cl_{\tau_u}(A) = [0,1] \not\subseteq U$ .

In Example 4.9,  $(\mathbf{R}, \tau_u)$  is anti-locally countable and  $A = (0,1) \cap \mathbf{Q} \in G\omega C(\mathbf{R}, \tau_u) - GC(\mathbf{R}, \tau_u)$ . Thus the condition that  $(A, \tau_A)$  is anti-locally countable in Corollary 4.5 cannot be replaced by the condition that  $(X, \tau)$  is anti-locally countable.

**Theorem 4.10.** Let  $(X, \tau)$  be an anti-locally countable space. Then  $(X, \tau)$  is a  $T_1$ -space if and only if every  $g\omega$ -closed set is  $\omega$ -closed.

*Proof.* We need to show the sufficiency part only. Let  $x \in X$  and suppose that  $\{x\}$  is not closed. Then  $A = X - \{x\}$  is not open, and thus  $A$  is  $g\omega$ -closed (the only open set containing  $A$  is  $X$ ). Therefore, by assumption,  $A$  is  $\omega$ -closed, and thus  $\{x\}$  is  $\omega$ -open. So there exists  $U \in \tau$  such that  $x \in U$  and  $U - \{x\}$  is countable. It follows that  $U$  is a nonempty countable open subset of  $(X, \tau)$ , a contradiction.

**Proposition 4.11.** If  $A = \{A_\alpha : \alpha \in I\}$  is a locally finite collection of  $g\omega$ -closed sets of a space  $(X, \tau)$ , then  $A = \bigcup_{\alpha \in I} A_\alpha$  is  $g\omega$ -closed (in particular, a finite union of  $g\omega$ -closed sets is  $g\omega$ -closed).

*Proof.* Let  $U$  be an open subset of  $(X, \tau)$  such that  $A \subseteq U$ . Since  $A_\alpha \in G\omega C(X, \tau)$  and  $A_\alpha \subseteq U$  for each  $\alpha \in I$ ,  $cl_{\tau_\omega}(A_\alpha) \subseteq U$ . As  $\tau_\omega$  is a topology on  $X$  finer than  $\tau$ ,  $A$  is locally finite in  $(X, \tau_\omega)$ . Therefore,  $cl_{\tau_\omega}(A) = cl_{\tau_\omega}(\bigcup_{\alpha \in I} A_\alpha) = \bigcup_{\alpha \in I} cl_{\tau_\omega}(A_\alpha) \subseteq U$ . Thus,  $A$  is  $g\omega$ -closed in  $(X, \tau)$ .

**Proposition 4.12.** If  $A \in G\omega C(X, \tau)$  and  $B$  is closed in  $(X, \tau)$ , then  $A \cap B \in G\omega C(X, \tau)$ .

Proof: Let  $U$  be an open set in  $(X, \tau)$  such that  $A \cap B \subseteq U$ . Put  $W = X - B$ . Then  $A \subseteq U \cup W \in \tau$ . Since  $A \in G\omega C(X, \tau)$ ,  $cl_{\tau_\omega}(A) \subseteq U \cup W$ . Now,  $cl_{\tau_\omega}(A \cap B) \subseteq cl_{\tau_\omega}(A) \cap cl_{\tau_\omega}(B) \subseteq cl_{\tau_\omega}(A) \cap cl_\tau(B) = cl_{\tau_\omega}(A) \cap B \subseteq (U \cup W) \cap B \subseteq U$ .

**Lemma 4.13.** (a) If  $A$  is an  $\omega$ -open subset of a space  $(X, \tau)$ , then  $A - C$  is  $\omega$ -open for every countable subset  $C$  of  $X$ .

(b) The open image of an  $\omega$ -open set is  $\omega$ -open.

*Proof.* Part (a) is clear. To prove part (b), let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be an open function and let  $W$  be an  $\omega$ -open subset of  $(X, \tau)$ . Let  $y \in f(W)$ . There exists  $x \in W$  such that  $y = f(x)$ . Choose  $U \in \tau$  such that  $x \in U$  and  $U - W = C$  is countable. Since  $f$  is open,  $f(U)$  is open in  $(Y, \sigma)$  such that  $y = f(x) \in f(U)$  and  $f(U) - f(W) \subseteq f(U - W) = f(C)$  is countable. Therefore,  $f(W)$  is  $\omega$ -open in  $(Y, \sigma)$ .

**Theorem 4.14.** Let  $(X, \tau)$  and  $(Y, \sigma)$  be two topological spaces. Then  $(\tau \times \sigma)_\omega \subseteq \tau_\omega \times \sigma_\omega$ . *Proof:* Let  $W \in (\tau \times \sigma)_\omega$  and  $(x, y) \in W$ . There exist  $U \in \tau$  and  $V \in \sigma$  such that  $(x, y) \in U \times V$  and  $U \times V - W = C$  is countable. Put  $W_1 = (U \cap p_X^{-1}(W)) - (p_X(C) - \{x\})$  and  $W_2 = (V \cap p_Y^{-1}(W)) - (p_Y(C) - \{y\})$ , where  $p_X : (X \times Y, \tau \times \sigma) \rightarrow (X, \tau)$  and  $p_Y : (X \times Y, \tau \times \sigma) \rightarrow (Y, \sigma)$  are the natural projections. Then  $W_1 \in \tau_\omega$ ,  $W_2 \in \sigma_\omega$  (Lemma 4.13) and  $(x, y) \in W_1 \times W_2 \subseteq W$ . Thus  $W \in \tau_\omega \times \sigma_\omega$ .

**Definition 4.15.** A subset  $A$  of a space  $(X, \tau)$  is called generalized  $\omega$ -open (briefly,  $g\omega$ -open) if its complement  $X - A$  is  $g\omega$ -closed in  $(X, \tau)$ .

It is clear that a subset  $A$  of a space  $(X, \tau)$  is  $g\omega$ -open if and only if  $F \text{ int}_{\tau_\omega}(A)$ , whenever  $F \subseteq A$  and  $F$  is closed in  $(X, \tau)$ .

**Theorem 4.16.** If  $A \times B$  is a  $g\omega$ -open subset of  $(X \times Y, \tau \times \sigma)$ , then  $A$  is  $g\omega$ -open in  $(X, \tau)$  and  $B$  is  $g\omega$ -open in  $(Y, \sigma)$ .

*Proof.* Let  $F_A$  be a closed subset of  $(X, \tau)$  and let  $F_B$  be a closed subset of  $(Y, \sigma)$  such that  $F_A \subseteq A$  and  $F_B \subseteq B$ . Then  $F_A \times F_B$  is closed in  $(X \times Y, \tau \times \sigma)$  such that  $F_A \times F_B \subseteq A \times B$ . By assumption,  $A \times B$  is  $g\omega$ -open in  $(X \times Y, \tau \times \sigma)$ , and so  $F_A \times F_B \subseteq \text{int}_{(\tau \times \sigma)_\omega}(A \times B) \subseteq \text{int}_{\tau_\omega}(A) \times \text{int}_{\sigma_\omega}(B)$  by using Theorem 4.14. Therefore,  $F_A \subseteq \text{int}_{\tau_\omega}(A)$  and  $F_B \subseteq \text{int}_{\sigma_\omega}(B)$ , and the result follows.

The converse of the above theorem need not be true in general.

**Example 4.17.** Let  $X = Y = \mathbb{R}$  with the usual topology  $\tau_u$ . Let  $A = \mathbb{R} - \mathbb{Q}$  and  $B = (0, 3)$ . Then  $A$  and  $B$  are  $\omega$ -open subsets of  $(\mathbb{R}, \tau_u)$ , while  $A \times B$  is not  $g\omega$ -open in  $(\mathbb{R} \times \mathbb{R}, \tau_u \times \tau_u)$ , since  $\text{int}_{(\tau_u \times \tau_u)_\omega}(A \times B) = \emptyset$  and  $\{\sqrt{2}\} \times [1, 2]$  is a closed set in  $(\mathbb{R} \times \mathbb{R}, \tau_u \times \tau_u)$  contained in  $A \times B$ .

**Theorem 4.18.** Let  $(Y, \tau_Y)$  be a subspace of a space  $(X, \tau)$  and  $A \subseteq Y$ . Then the following hold.

(a) If  $A \in G\omega C(X, \tau)$ , then  $A \in G\omega C(Y, \tau_Y)$ .

(b) If  $A \in G\omega C(Y, \tau_Y)$  and  $Y$  is  $\omega$ -closed in  $(X \times Y, \tau)$ , then  $A \in G\omega C(X, \tau)$ .

Proof. (a) Let  $V$  be an open set of  $(Y, \tau_Y)$  such that  $A \subseteq V$ . Then there exists an open set  $U \subseteq \tau$  such that  $V = Y \cap U$ . Since  $A \in G\omega C(X, \tau)$  and  $A \subseteq U$ ,  $cl_{\tau_\omega}(A) \subseteq U$ . Now,  $cl_{(\tau_Y)_\omega}(A) = cl_{(\tau_\omega)Y}(A) = cl_{\tau_\omega}(A) \cap Y \subseteq Y \cap U = V$ . Therefore,  $A \in G\omega C(Y, \tau_Y)$ .

(b) Let  $A \subseteq U$ , where  $U \in \tau$ . Then  $A \subseteq Y \in U \in \tau_Y$ . Since  $A \in G\omega C(Y, \tau_Y)$ ,  $cl_{(\tau_Y)_\omega}(A) = cl_{(\tau_\omega)Y}(A) = cl_{\tau_\omega}(A) \cap Y \subseteq Y \cap U$ . Finally,  $cl_{\tau_\omega}(A) = cl_{\tau_\omega}(A \cap Y) \subseteq cl_{\tau_\omega}(A) \cap cl_{\tau_\omega}(Y) = (Y \text{ is } \omega\text{-closed}) cl_{\tau_\omega}(A) \cap Y \subseteq Y \cap U \subseteq U$ . Thus  $A \in G\omega C(X, \tau)$ .

# SELF MAPS ON QS-ALGEBRA

P. Jainumbu Beevi

Assistant Professor, PG and Research Department of Mathematics

Saiva Bhanu Kshatriya College

Aruppukottai -626101, Tamil Nadu, India

**Abstract:** In this paper, we define the concept of Self maps(Left & Right maps) on QS-Algebra and investigate some of their elegant and simple results.

**AMS Classification:** 06F35, 03G25

**Key words:** QS-algebras, Left(L)- maps and Right(R)-maps on QS-algebras.

## 1. INTRODUCTION

Ahn and Kim [1] proposed the notion of QS-algebras which also a generalization of BCK/BCI-algebras. In [2], Y.B. Jun, E.H. Kim introduced a new class of algebras, called BH-algebras, which is also generalization of BCH/BCI/BCI-algebras. In [4], the authors, studied some relations between Left-(Right-) maps and positive implicativity in BH-algebras. We introduced some special type of mapping on QS-algebras called the left (or) right maps in QS-algebras X.

## 2. PRELIMINARIES

In this section, we recall some basic definition and results that are required for our work.

**Definition 2.1:** [1] A QS-algebras  $(X, *, 0)$  is a non-empty X with the constant 0 and single binary operation \* satisfying the following actions:

1.  $x * x = 0$
2.  $x * 0 = x$
3.  $(x * y) * z = (x * z) * y$
4.  $(x * y) * (x * z) = z * y$  for all  $x, y, z$  in X

**Example 2.2:** Let  $(X=\{0,1,2,3\}, *, 0)$  be a set with the following Cayley table:

*	0	1	2	3
0	0	1	2	3
1	1	0	1	1
2	2	1	0	0
3	3	1	3	0

Then  $(X, *, 0)$  is QS-algebras.

**Remark 2.3:**[2] Let  $(X, *, 0)$  be a QS-algebras. Define  $x \wedge y = y * (y * x)$ , for all  $x, y$  in X.

A QS-algebras X is said to be commutative if  $x \wedge y = y \wedge x$ , for all  $x, y$  in X.

**Definition 2.4:**[3] A BH-algebras  $(X, *, 0)$  is a non empty set X with a constant 0 and single binary operation \* satisfying the following axioms:

1.  $x * x = 0$
2.  $(x * y) * z = (x * z) * y$
3.  $x * y = 0$  and  $y * x = 0 \Rightarrow x = y$ , for all  $x, y, z$  in X.

**Example 2.5:** Let  $(X=\{0,1,2,3\}, *, 0)$  be a set with the following Cayley table:

*	0	1	2	3
0	0	0	0	0
1	1	0	3	1
2	2	2	0	3
3	3	1	2	0

Then  $(X, *, 0)$  is BH-algebras.

**Definition 2.6:** [4] Let  $(X, *, 0)$  be BH-algebras.

- For fixed  $a$  in  $X$ , we define a map  $R_a : X \rightarrow X$  such that  $R_a(x) = x * a, \forall x \in X$ . Then  $R_a$  is called a right map on  $X$ . The set of all right map on  $X$  is denoted by  $\mathbf{R}$ .
- For fixed  $a$  in  $X$ , we define a map  $L_a : X \rightarrow X$  such that  $L_a(x) = a * x, \forall x \in X$ . Then  $L_a$  is called a left map on  $X$ . The set of all left map on  $X$  is denoted by  $\mathbf{L}$ .

**Example 2.7:** Let  $(X=\{0,1,2\}, *, 0)$  be a BH-algebras with following Cayley table:

*	0	1	2
0	0	0	0
1	1	0	1
2	2	2	0

Define a function  $f : X \rightarrow X$  by  $f(x) = 0$  if  $x = 0, 1$  and  $f(x) = 2$  if  $x=2$

Fix  $a = 2$ , the map  $R_2(x) = x * 2$ , for all  $x$  in  $X$ . Hence the function  $f$  on  $X$  becomes a right map  $R_2$  on  $X$

**Example 2.7:** Let  $(X=\{0,1,2\}, *, 0)$  be a BH-algebras with following Cayley table:

*	0	1	2
0	0	0	0
1	1	0	1
2	2	2	0

Define a function  $f : X \rightarrow X$  by  $f(x) = 1$  if  $x = 0, 2$  and  $f(x) = 0$  if  $x=1$

Fix  $a = 1$ , the map  $L_2(x) = 1 * x, \forall x \in X$ . Hence the function  $f$  on  $X$  becomes a left map  $L_2$  on  $X$ .

**Definition 2.8:** [1] A subset  $A$  of a QS-algebras  $X$  is called and *ideal* of  $X$  if it satisfies:

1.  $0 \in A$
2. for all  $y \in A$  and  $x * y \in A$  imply  $x \in A$ , for all  $x \in X$ .

Obviously,  $\{0\}$  and  $X$  are ideal of  $X$ .

**Definition 2.9:** [1] If  $(X, *, 0)$  be a QS-algebras then we define a partial ordering  $\leq$  by  $x \leq y$  if  $x * y = 0$ .

**Definition 2.10:** [4] Let  $X$  be a BH-algebras and let  $R_a$  and  $L_a$  be a right and left maps on  $X$ . We have the following subsets of  $X$  corresponding to  $L_a$  and  $R_a$  respectively.

$$\mathbf{Ker}(L_a) = \{x \in X / L_a(x) = 0\}$$

$$\mathbf{Ker}(R_a) = \{x \in X / R_a(x) = 0\}$$

### 3. LEFT AND RIGHT MAPS ON QS-ALGEBRAS

**Definition 3.1:** Let  $(X, *, 0)$  be QS-algebras.

- For fixed  $a$  in  $X$ , we define a map  $L_a: X \rightarrow X$  such that  $L_a(x) = a * x, \forall x \in X$ . Then  $L_a$  is called a left map on  $X$ . The set of all left map on  $X$  is denoted by **L**.
- For fixed  $a$  in  $X$ , we define a map  $R_a: X \rightarrow X$  such that  $R_a(x) = x * a, \forall x \in X$ . Then  $R_a$  is called a right map on  $X$ . The set of all right map on  $X$  is denoted by **R**.

**Example 3.2:** Let  $(X=\{0,1,2\}, *, 0)$  be a QS-algebras with following Cayley table:

*	0	1	2
0	0	2	1
1	1	0	2
2	2	0	2

Define a function  $f: X \rightarrow X$  by  $f(x) = 2$  if  $x = 0$  and  $f(x) = 0$ , otherwise

Fix  $a = 1$ , the map  $R_1(x) = x * 1, \forall x \in X$ . Hence the function  $f$  on  $X$  becomes a right map  $R_1$  on  $X$

**Example 3.3:** Let  $(X=\{0,a,b,c\}, *, 0)$  be a set with the following Cayley table:

*	0	1	2	3
0	0	1	2	3
1	1	0	1	1
2	2	1	0	0
3	3	1	3	0

Define a function  $f: X \rightarrow X$  by  $f(x) = 0$  if  $x=2,3$ ,  $f(x) = 2$  if  $x=0$  and  $f(x) = 1$  if  $x=1$ .

Fix  $a=2$ , the map  $L_2(x) = 2 * x, \forall x \in X$ . Hence the function  $f$  on  $X$  becomes a right map  $L_2$  on  $X$

**Proposition 3.4:** Let  $X$  be a QS-algebras. Then for any  $x, y$  and  $z$  in  $X$ , the following results holds:

1.  $x * (x * y) = y$
2.  $0 * (x * y) = y * x = (0 * x) * (0 * y)$
3.  $(x * (x * y)) * y = 0$
4. If  $x * y = 0$  and  $y * x = 0$  then  $x = y$ , for all  $x, y$  in  $X$
5.  $(x * z) * (y * z) = x * y$

**Proof:**

1.  $(x * y) = (x * 0) * (x * y)$  by (1) of definition 2.1  
 $= y * 0$  by (4) of definition 2.1  
 $= y$  by (1) of definition 2.1
2.  $0 * (x * y) = (x * x) * (x * y)$  by (1) of definition 2.1  
 $= y * x$  by (4) of definition 2.1  
 $= (0 * x) * (0 * y)$  by (4) of definition 2.1
3.  $(x * (x * y)) * y = ((x * 0) * (x * y)) * y$  by (2) of definition 2.1  
 $= (y * 0) * y$  by (4) of definition 2.1  
 $= y * y$  by (2) of definition 2.1  
 $= 0$  by (1) of definition 2.1

4.  $x = x * 0 = x * (x * y) = (x * 0) * (x * y) = y * 0 = y$   
 $y = y * 0 = y * (y * x) = (y * 0) * (y * x) = x * 0 = x$
5. *Suppose  $(x * z) * (y * z) \neq x * y$ . Then*

$$\begin{aligned} ((x * z) * (y * z)) * (x * y) &\neq (x * y) * (x * y) \\ &\neq y * y \quad \text{by (4) of definition 2.1} \\ &\neq 0 \quad \text{by (1) of definition 2.1} \end{aligned}$$

This contradiction the condition  $((x * z) * (y * z)) * (x * y) = 0$ , and prove that  $(x * z) * (y * z) = x * y$

**Proposition 3.5** Let  $X$  be a QS-algebras.

For every natural number  $n$ ,  $L_a^n = L_a$  if  $n$  odd and  $L_a^n = L_a^2$  if  $n$  is even.

**Proof:** Let  $x \in X$ .

Let  $x \in X$ .

**Case (i):**  $n$  is odd.

Assume now that, the result is true for  $n=2m+1$ .

That is,  $L_a^{2m+1}(x) = L_a(x)$  ..... (1)

$$\begin{aligned} \text{Now, } L_a^{2m+3}(x) &= L_a^2(L_a^{2m+1}(x)) = L_a^2(L_a(x)) \quad \text{by (1)} \\ &= L_a^3(x) \\ &= L_a(x) \end{aligned}$$

Thus the result is true for any  $n$  which an odd number.

**Case (ii):**  $n$  is even.

Again assume that, the result is true for  $n=2m$ .

That is,  $L_a^{2m}(x) = L_a^2(x)$  ..... (2)

$$\begin{aligned} \text{Now, } L_a^{2m+2}(x) &= L_a^2(L_a^{2m}(x)) = L_a^2(L_a^2(x)) \quad \text{by (2)} \\ &= L_a^4(x) \\ &= L_a^2(x) \end{aligned}$$

Thus the result is true for any  $n$  which an even number.

Hence the result is true for every natural number  $n$ ,  $L_a^n = L_a$  if  $n$  odd and  $L_a^n = L_a^2$  if  $n$  is even.

**Proposition 3.6:** Let  $X$  be a QS-algebras. Then for all  $x, y$  in  $X$ , we have

1.  $L_a^2(x) * L_a(y) = L_a^2(y) * L_a(x)$
2.  $L_a^2(x) * y = L_a(y) * L_a(x) = L_a^2(x) * L_a^2(y)$

**Proof:** Let  $x, y \in X$ .

1.  $L_a^2(x) * L_a(y) = (a * (a * x)) * (a * y) \quad \text{by definition 3.1}$   
 $= (a * (a * y)) * (a * x) \quad \text{by (3) of definition 2.1}$   
 $= L_a^2(y) * L_a(x) \quad \text{by definition 3.1}$
2.  $L_a^2(x) * y = (a * (a * x)) * y$   
 $= (a * y) * (a * x) \quad \text{by (3) of definition 2.1}$   
 $= L_a(y) * L_a(x) \quad \text{.....(1') by definition 3.1}$   
 $L_a^2(x) * L_a^2(y) = (a * (a * x)) * (a * (a * y))$   
 $= (a * (a * (a * y))) * (a * x) \quad \text{by (3) of definition 2.1}$   
 $= (a * y) * (a * x) \quad \text{by proposition 3.4}$   
 $= L_a(y) * L_a(x) \quad \text{by definition 3.1 .....(2')}$

From (1') and (2'), we get  $L_a^2(x) * y = L_a(y) * L_a(x) = L_a^2(x) * L_a^2(y)$

**Proposition 3.7:** Let  $X$  be a QS-algebras. Then the following results hold,

1.  $L_a^2$  is isotonic, i.e,  $x \leq y$  implies  $L_a^2(x) \leq L_a^2(y)$
2.  $L_a^2(x) = 0$  if and only if  $R_x(a) = a$

**Proof:** Let  $x \in X$ .

Let  $x \leq y$ . Then  $x * y = 0$  ..... (1') by definition 2.8

1.  $L_a^2(x) * L_a^2(y) = L_a^2(x) * y$  by proposition 3.6  
 $= (a * (a * x)) * y$   
 $= x * y$  by (1) of proposition 3.4  
 $= 0$  by (1')

By definition of partial order, we get  $L_a^2(x) \leq L_a^2(y)$

2. Let  $L_a^2(x) = 0$  iff  $L_a(L_a(x)) = 0$   
iff  $a * (a * x) = 0$  by definition 3.1  
iff  $a * (a * x) = a * a$  by (1) of definition 2.1  
iff  $a * R_x(a) = a * a$  by definition 3.1  
iff  $R_x(a) = a$  by left cancellation law

**Proposition 3.8:** Let  $X$  be a QS-algebras and let  $L_a$  be a left map on  $X$ . If  $x \in Ker(L_a)$  and  $y \in X$ , then  $x \wedge y \in Ker(L_a)$ .

**Proof:** Let  $y \in X$

Let  $x \in Ker(L_a)$ . Then  $L_a(x) = 0$  ..... (1) by definition 2.10

$$\begin{aligned} L_a(x \wedge y) &= L_a(y * (y * x)) \text{ by remark 2.3} \\ &= L_a(x) \text{ by proposition 3.4} \\ &= 0 \text{ by (1)} \end{aligned}$$

Therefore  $x \wedge y \in Ker(L_a)$ .

**Proposition 3.9:** Let  $X$  be a QS-algebras. Then for any  $a$  in  $X$ ,  $Ker(L_a^2)$  is ideal of  $X$ .

**Proof:** Since  $L_a^2(0)=0$ , we get  $0 \in Ker(L_a^2)$

If  $y, x * y \in Ker(L_a^2)$  then  $L_a^2(y)=0$  and  $L_a^2(x * y)=0$  ..... (1)

$$\begin{aligned} L_a^2(x) &= L_a^2(x) * L_a^2(x * y) \text{ by (1)} \\ &= L_a^2(x) * (x * y) \text{ by (2) of proposition 3.6} \\ &= (L_a^2(x) * L_a^2(y)) * (x * y) \text{ by (1)} \\ &= (L_a^2(x) * y) * (x * y) \text{ by (2) of proposition 3.6} \\ &= L_a^2(x) * x \text{ by (5) of proposition 3.4} \\ &= L_a(x) * L_a(x) \text{ by (2) of proposition 3.6} \\ &= 0 \text{ by (1) definition 2.1} \end{aligned}$$

Therefore,  $x * y \in Ker(L_a^2)$ . Hence  $Ker(L_a^2)$  is ideal of  $X$ .

**ABSTRACT:** *In this paper, introduce the notion on Pythagorean fuzzification of subalgebra in  $\beta$  – algebra. Also discuss some basic concepts of results and investigate their several properties.*

**Keywords:**  *$\beta$  - algebra, Pythagorean fuzzy set, Pythagorean fuzzy  $\beta$  - algebra, Pythagorean fuzzy level set*

**AMS Classification:** 08A72, 03E72

## 1. INTRODUCTION:

In 1965, Fuzzy set (FS) was developed by Lofti.A Zadeh [5] and he discussed membership function only. By this way, in 1986, Atanasov [1] introduced the notion of Intuitionistic Fuzzy set (IFS) in which not only the membership value is considered but also consider non-membership values. After that, many researchers used the fuzzy and Intuitionistic Fuzzy set apply in many areas. In another extended of a Fuzzy set, in 2013, Yager [3] [4], introduced a new concept of non – standard fuzzy sets called a Pythagorean fuzzy sets (PFS) and related ideas of Pythagorean membership function grades. In 2002, J. Neggers and H.S. Kim [2], introduced a class of algebras called  $\beta$ - algebras. This paper dealt the idea of Pythagorean fuzzy on  $\beta$ - sub algebras and Pythagorean fuzzy on level  $\beta$ - algebra, by connecting the concepts  $\beta$ - algebras, Pythagorean fuzzy set. Also proved some of their properties and relation between Intuitionistic Fuzzy  $\beta$ - algebras and Pythagorean fuzzy  $\beta$ -algebras.

## 2. PRELIMINARIES:

In this section we recall some basic definitions that are required in the sequel.

**Definition 2.1:** A  $\beta$ -algebra is a non-empty set  $X$  with a constant  $0$  and two binary operations  $+$  and  $-$  satisfying the following axioms:

1.  $x - 0 = x$
2.  $(0 - x) + x = 0$
3.  $(x - y) - z = x - (z + y)$  for all  $x, y, z \in X$ .

**Definition 2.2:** Let  $X$  be a set of universal discourse and a fuzzy set  $\mu$  in  $X$  is a function  $\mu : X \rightarrow [0, 1]$ . For each element  $x$  in  $X$ ,  $\mu(x)$  lies between 0 and 1 and  $\mu(x)$  is called the membership value of  $x$  in  $X$ .

**Definition 2.3:** A non-empty subset  $I$  of a  $\beta$ - algebra  $(X, +, -, 0)$  is called a  $\beta$ - ideal of  $X$ , if

1.  $0 \in I$
2.  $x + y \in I \forall x, y \in X$
3. if  $x - y$  and  $y \in I$  then  $x \in I \forall x, y \in X$ .

**Definition 2.4:** Let  $\mu$  be a fuzzy set in a  $\beta$ - algebra  $X$ . Then  $\mu$  is called a fuzzy  $\beta$ - subalgebra of  $X$  if

1.  $\mu(x + y) \geq \min \{\mu(x), \mu(y)\} \forall x, y \in X$ .
2.  $\mu(x - y) \geq \min \{\mu(x), \mu(y)\} \forall x, y \in X$ .

**Definition 2.5:** An intuitionistic fuzzy set in a nonempty set  $X$  is defined by

$A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$ ,  $\forall x \in X$ , where  $\mu_A : X \rightarrow [0, 1]$  is a membership function of  $A$ .  $\nu_A : X \rightarrow [0, 1]$  is a non-membership function of  $A$  and satisfies  $0 \leq \mu_A(x) + \nu_A(x) \leq 1$ .

**Definition 2.6:** Let  $(X, +, -, 0)$  be a  $\beta$  algebra. An Intuitionistic fuzzy set  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$  is called an Intuitionistic fuzzy (IF)  $\beta$  subalgebra of  $X$ , if it satisfies the following conditions.

1.  $\mu_A(x + y) \geq \min(\mu_A(x), \mu_A(y))$  and  $\nu_A(x + y) \leq \max(\nu_A(x), \nu_A(y))$ ,
2.  $\mu_A(x - y) \geq \min(\mu_A(x), \mu_A(y))$  and  $\nu_A(x - y) \leq \max(\nu_A(x), \nu_A(y))$ ,  $\forall x, y \in X$ ,  
where  $0 \leq \mu_A(x) + \nu_A(x) \leq 1$ .

**Definition 2.7: Pythagorean Fuzzy Set**

Let  $X$  be a non-empty set. A Pythagorean fuzzy set 'A' is an object having the form  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \} \forall x \in X$ , where the membership function  $\mu_A : X \rightarrow [0, 1]$  and the non-membership function  $\nu_A : X \rightarrow [0, 1]$  respectively and satisfies  $0 \leq \mu_A(x)^2 + \nu_A(x)^2 \leq 1$ .

**Definition 2.8:** Let  $X$  and  $Y$  be two  $\beta$ - algebras. A mapping  $f : X \rightarrow Y$  is said to be a  $\beta$  - homomorphism, if  $f(x + y) = f(x) + f(y)$  and  $f(x - y) = f(x) - f(y)$  for all  $x, y \in X$ .

### 3. PYTHAGOREAN FUZZY ON $\beta$ – ALGEBRAS :

In this section, introduce the notion of Pythagorean fuzzy  $\beta$ - subalgebra on  $\beta$ - algebra. We begin with the definition and example. Also discuss relation between Intuitionistic fuzzy  $\beta$ - subalgebra and Pythagorean fuzzy  $\beta$ - subalgebra.

**Definition 3.1:**

Let  $(X, +, -, 0)$  be a  $\beta$  algebra. A Pythagorean fuzzy set  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$  is called a Pythagorean fuzzy (PF)  $\beta$ - subalgebra of  $X$ , if it satisfies the following conditions

- (1)  $\mu_A(x + y) \geq \min(\mu_A(x), \mu_A(y))$  and  $\nu_A(x + y) \leq \max(\nu_A(x), \nu_A(y))$ ,
- (2)  $\mu_A(x - y) \geq \min(\mu_A(x), \mu_A(y))$  and  $\nu_A(x - y) \leq \max(\nu_A(x), \nu_A(y))$ ,  $\forall x, y \in X$ ,  
Where  $0 \leq \mu_A(x)^2 + \nu_A(x)^2 \leq 1$ .

**Example 3.2:** The  $\beta$ -algebra  $X = (\{0, 1, 2\}, +, -, 0)$  with the following Cayley's table.

+	0	1	2
0	0	1	2
1	1	2	0
2	2	0	1

-	0	1	2
0	0	2	1
1	1	0	2
2	2	1	0

A Pythagorean fuzzy  $\beta$  – subalgebra is defined by

$$\mu_A(x) = \begin{cases} 0.4, & \text{if } x = 0 \\ 0.3, & \text{otherwise} \end{cases} \quad \text{and} \quad \nu_A(x) = \begin{cases} 0.8, & \text{if } x = 0, 1, 2, 3 \end{cases}$$

Then we can observe that  $A$  is a Pythagorean fuzzy  $\beta$  – subalgebra of  $X$ .

**Example 3.3:** Consider the  $\beta$ - algebra of example 3. 2. The set A defined by

$$\mu_A(x) = \begin{cases} 0.4, & \text{if } x = 0 \\ 0.3, & \text{otherwise} \end{cases} \quad \text{and} \quad \vartheta_A(x) = \begin{cases} 0.7, & \text{if } x = 0 \\ 0.8, & \text{if } x = 1 \\ 0.2, & \text{if } x = 2 \end{cases}$$

is not a Pythagorean fuzzy  $\beta$ - subalgebra of X.

For,  $\vartheta_A(1 + 1) \geq \max \{\vartheta_A(1), \vartheta_A(1)\} \Rightarrow \vartheta_A(2) \geq \max \{\vartheta_A(1), \vartheta_A(1)\} \Rightarrow .2 \geq \max \{.8, .8\}$ .

**Theorem 3.4** Let A and B be a Pythagorean fuzzy  $\beta$ - subalgebras of X. Then  $A \cap B$  is also a Pythagorean fuzzy  $\beta$ - subalgebra of X.

In general, the intersection of a family of Pythagorean fuzzy  $\beta$ - subalgebras of X is also a Pythagorean fuzzy  $\beta$ - subalgebra of X.

**Proposition 3.5:** Every Pythagorean fuzzy  $\beta$ - subalgebra of X satisfies the following condition.

$$\mu_A(0) \geq \mu_A(x) \quad \text{and} \quad \vartheta_A(0) \leq \vartheta_A(x) \quad \text{for all } x \in X.$$

**Proof:**

$$\text{For any } x \in X. \mu_A(0) = \mu_A(x - x) \geq \min(\mu_A(x), \mu_A(x)) = \mu_A(x).$$

$$\text{Therefore } \mu_A(0) \geq \mu_A(x).$$

$$\text{And } \vartheta_A(0) = \vartheta_A(x - x) \leq \max(\vartheta_A(x), \vartheta_A(x)) = \vartheta_A(x).$$

$$\text{Therefore } \vartheta_A(0) \leq \vartheta_A(x).$$

**Theorem 3.6** If A is a Pythagorean fuzzy  $\beta$ - subalgebra of X, then  $\mu_A(x) \leq \mu_A(x - 0)$  and  $\vartheta_A(x) \geq \vartheta_A(x - 0)$ .

**Proof:**

Let A be a Pythagorean fuzzy  $\beta$ - subalgebra of X.

$$\begin{aligned} \text{Then } \mu_A(x - 0) &\geq \min(\mu_A(x), \mu_A(0)) \\ &= \min(\mu_A(x), \mu_A(x - x)) \\ &\geq \min\{\mu_A(x), \min(\mu_A(x), \mu_A(x))\} \\ &= \min(\mu_A(x), \mu_A(x)) \\ &= \mu_A(x) \end{aligned}$$

Similarly, we can prove that,  $\vartheta_A(x - 0) \leq \vartheta_A(x)$ .

**Definition 3.7:** Let  $f : X \rightarrow Y$  be a function. Let A and B be two Pythagorean  $\beta$ - subalgebras in X and Y respectively. Then inverse image of B under f is defined by  $f^{-1}(B) = \{f^{-1}(\mu_B(x)), f^{-1}(\vartheta_B(x)) | x \in X\}$  such that  $f^{-1}(\mu_B(x)) = (\mu_B(f(x)))$  and  $f^{-1}(\vartheta_B(x)) = (\vartheta_B(f(x)))$ .

**Theorem 3.8:** Let X and Y be two Pythagorean  $\beta$ - subalgebras. Let  $f : X \rightarrow Y$  be a homomorphism. If A is of Pythagorean  $\beta$ - subalgebra of Y, then  $f^{-1}(A)$  is a Pythagorean  $\beta$ - subalgebra of X.

**Proof:**

Let A be a Pythagorean  $\beta$ - subalgebra of Y,  $x, y \in Y$ .

$$\begin{aligned} f^{-1}(\mu_A(x + y)) &= \mu_A(f(x + y)) \\ &= \mu_A(f(x) + f(y)) \geq \min\{\mu_A(f(x)), \mu_A(f(y))\} \\ &= \min(f^{-1}(\mu_A(x)), f^{-1}(\mu_A(y))) \end{aligned}$$

$$\text{And } f^{-1}(\mu_A(x - y)) \geq \min\{f^{-1}(\mu_A(x)), f^{-1}(\mu_A(y))\}$$

Similarly, we can prove,

$$\begin{aligned} f^{-1}(\vartheta_A(x+y)) &= \vartheta_A(f(x+y)) \\ &= \vartheta_A(f(x) + f(y)) \\ &\leq \max\{\vartheta_A f(x), \vartheta_A f(y)\} \\ &= \max(f^{-1}(\vartheta_A(x)), f^{-1}(\vartheta_A(y))) \end{aligned}$$

And  $f^{-1}(\vartheta_A(x-y)) \leq \max\{f^{-1}(\vartheta_A(x)), f^{-1}(\vartheta_A(y))\}$

Hence  $f^{-1}(A)$  is a Pythagorean  $\beta$ -subalgebra of  $X$ .

Relation between Pythagorean fuzzy  $\beta$ -subalgebra and Intuitionistic fuzzy  $\beta$ -subalgebra

**Remark 3.9:** Every Intuitionistic fuzzy  $\beta$ -subalgebra is a Pythagorean fuzzy  $\beta$ -subalgebra. But converse need not be true.

That means, Every Pythagorean fuzzy  $\beta$ -subalgebra is not an Intuitionistic fuzzy  $\beta$ -subalgebra.

The above example 3.2, Pythagorean fuzzy  $\beta$ -subalgebra is not an Intuitionistic fuzzy  $\beta$ -subalgebra.

For, an Intuitionistic fuzzy  $\beta$ -subalgebra satisfies,  $0 \leq \mu_A(x) + \nu_A(x) \leq 1$ .

But  $x = 1, (\mu_A(1) + \nu_A(1)) \Rightarrow (0.3 + 0.8) \Rightarrow 1.1 \notin [0, 1]$ .

Then we can observe that  $A$  is a Pythagorean fuzzy  $\beta$ -subalgebra of  $X$  but not an Intuitionistic fuzzy  $\beta$ -subalgebra.

Now, we define the Cartesian product of the two PF  $\beta$ -subalgebras  $A$  and  $B$  of the  $\beta$ -algebras  $X$  and  $Y$  respectively.

**Definition 3.10:** Let  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$  and  $B = \{ \langle y, \mu_B(y), \nu_B(y) \rangle \mid y \in Y \}$  be two Intuitionistic fuzzy  $\beta$ -subalgebras of  $X$  and  $Y$  respectively. The Cartesian product of  $A$  and  $B$  is  $A \times B = \{ (\mu_A \times \mu_B)(x, y) \text{ and } (\nu_A \times \nu_B)(x, y) \mid x, y \in X \times Y \}$  where  $(\mu_A \times \mu_B)(x, y) =$

$\min(\mu_A(x), \mu_B(y))$  and  $(\nu_A \times \nu_B)(x, y) = \max(\nu_A(x), \nu_B(y))$ .

**Theorem 3.11:** Let  $A$  and  $B$  be PF  $\beta$ -subalgebras of  $X$  and  $Y$  respectively. Then  $A \times B$  is a PF  $\beta$ -subalgebra of  $X \times Y$ .

**Proof:**

Take  $x = (x_1, x_2), y = (y_1, y_2) \in X \times Y, \mu_{(A \times B)} = \mu_A \times \mu_B$  and  $\nu_{(A \times B)} = \nu_A \times \nu_B$ .

$$\begin{aligned} \mu_{(A \times B)}(x+y) &= \mu_{(A \times B)}((x_1, x_2) + (y_1, y_2)) \\ &= (\mu_A \times \mu_B)(x_1 + y_1, (x_2 + y_2)) \\ &= \min\{\mu_A(x_1 + y_1), \mu_B(x_2 + y_2)\} \\ &\geq \min\{\min(\mu_A(x_1), \mu_A(y_1)), \min(\mu_B(x_2), \mu_B(y_2))\} \\ &= \min\{\min(\mu_A(x_1), \mu_B(x_2)), \min(\mu_A(y_1), \mu_B(y_2))\} \\ &= \min\{(\mu_A \times \mu_B)(x_1, x_2), (\mu_A \times \mu_B)(y_1, y_2)\} \\ &= \min\{(\mu_A \times \mu_B)(x), (\mu_A \times \mu_B)(y)\} \end{aligned}$$

Similarly,  $\mu_{(A \times B)}(x-y) \geq \min\{(\mu_A \times \mu_B)(x), (\mu_A \times \mu_B)(y)\}$ .

Analogously, we can prove that,

$\nu_{(A \times B)}(x+y) \leq \max\{(\nu_A \times \nu_B)(x), (\nu_A \times \nu_B)(y)\}$  and

$\nu_{(A \times B)}(x-y) \leq \max\{(\nu_A \times \nu_B)(x), (\nu_A \times \nu_B)(y)\}$ .

**Theorem 3.12:** Let  $A \times B$  be a PF  $\beta$ -subalgebra of  $X \times X$ .

Then the following hold

1. either  $\mu_A(x) \leq \mu_A(0)$  or  $\mu_B(x) \leq \mu_B(0)$

2. either  $v_A(x) \geq v_B(0)$  or  $v_B(x) \geq v_B(0)$

**Proof:** 1) Suppose  $\mu_A(x) > \mu_A(0)$  and  $\mu_B(x) > \mu_B(0)$ , for all  $x, y \in X$ .

$$\begin{aligned} \text{Then } (\mu_A \times \mu_B)(x+y) &\geq \min(\mu_A(x), \mu_A(y)) \\ &> \min(\mu_A(0), \mu_A(0)) \\ &= (\mu_A \times \mu_B)(0, 0) \end{aligned}$$

which is contradiction.

Similarly,  $(\mu_A \times \mu_B)(x-y) > (\mu_A \times \mu_B)(0, 0)$ . which is contradiction.

2) Proceeding as in part (1), we can prove (2).

#### 4. LEVEL OF PF- $\beta$ SUBALGEBRAS:

In this section, we introduce the notion of level subsets of PF  $\beta$ - subalgebras of  $\beta$ - algebra.

**Definition 4.1:**

Let  $A$  be PF-  $\beta$  subalgebra of  $X$ ,  $s, t \in [0, 1]$ . Then  $A_{s,t} = \{x \in X \mid \mu_A(x) \geq s, v_A(x) \leq t\}$  where

$0 \leq \mu_A(x)^2 + v_A(x)^2 \leq 1$  is called a level such that associated with the PF-  $\beta$  subalgebra of  $A$ . Clearly,  $A_{s,t} \subseteq X$ .

**Theorem 4.2:** If  $A = (\mu_A, v_A)$  is a PF  $\beta$ - subalgebra of  $X$ , then the set  $A_{s,t}$  is a  $\beta$ - subalgebra of  $X$ , for every  $s, t \in [0, 1]$ .

**Proof:** For  $x, y \in (\mu_A)s$ , then  $\mu_A(x) \geq s$  and  $\mu_A(y) \geq s$

$$\begin{aligned} \Rightarrow \mu_A(x+y) &\geq \min\{\mu_A(x), \mu_A(y)\} \\ &\geq \min\{s, s\} \\ &\geq s \end{aligned}$$

$$\Rightarrow x+y \in (\mu_A)s$$

Similarly it can be proved that  $x-y \in (\mu_A)s$

$$\begin{aligned} \text{And } v_A(x+y) &\leq \max\{v_A(x), v_A(y)\} \\ &\leq \max\{t, t\} \\ &\leq t \end{aligned}$$

$$\Rightarrow x+y \in (v_A)t$$

Similarly it can be proved that  $x-y \in (v_A)t$

Hence  $A_{s,t}$  is subalgebra of  $X$ .

**Theorem 4.3:** Let  $A = (\mu_A, v_A)$  is a PF set in  $X$  such that  $A_{s,t}$  is a  $\beta$ - subalgebra of  $X$  for every  $s, t \in [0, 1]$ . Then  $A$  is a PF  $\beta$ - subalgebra of  $X$ .

**Proof:** Let  $A = (\mu_A, v_A)$  is a PF set in  $X$ .

Assume that  $A_{s,t}$  is a  $\beta$ - subalgebra of  $X$  for every  $s, t \in [0, 1]$ .

$$\therefore x+y \in A_{s,t} \Rightarrow \mu_A(x+y) \geq s \text{ and } v_A(x+y) \leq t.$$

$$\text{That is } \mu_A(x+y) \geq s = \min\{\mu_A(x), \mu_A(y)\} \text{ and } \mu_A(x+y) \leq t = \max\{v_A(x), v_A(y)\}$$

Similarly, we can prove that  $\mu_A(x-y) \geq s = \min\{\mu_A(x), \mu_A(y)\}$  and

$$\mu_A(x-y) \leq t = \max\{\mu_A(x), v_A(y)\}$$

Thus  $A = (\mu_A, v_A)$  is an IF  $\beta$ - subalgebra of  $X$ .

**Theorem 4.4:** Let  $A = (\mu_A, v_A)$  be an IF-  $\beta$  subalgebra of  $X$  iff for all  $s, t \in [0, 1]$  level set  $A_{s,t}$  is either empty or  $\beta$ - subalgebra of  $X$ .

**Proof:** Straight forward.

## 5. CONCLUSION:

In this paper several interesting results were discussed by joining the notions of Pythagorean fuzzy set and  $\beta$ -subalgebras. One can further study on rough fuzzy, rough Pythagorean fuzzy and Tripolar Pythagorean fuzzy sub structures by connecting with on  $\beta$ -algebras.

# GENERALIZED JORDAN RIGHT DERIVATION ASSOCIATED WITH RIGHT(JORDAN RIGHT) DERIVATION ON SEMIRINGS

**S. Kavitha**

Assistant Professor, PG and Research Department of Mathematics,  
Saiva Bhanu Kshatriya College,  
Aruppukottai - 626101, Tamil Nadu, India.  
E-mail:kavithasakthivelapk@gmail.com

**ABSTRACT:** *In this paper, we introduce the notion of Generalized Jordan right derivation associated with right (Jordan right) derivation on semirings. We discuss some definitions and examples, and also we prove some elegant results.*

**Mathematics Subject Classification:** 16Y60

**Keywords:** *Semirings, Jordan right derivation, generalized Jordan right derivation.*

## 1. INTRODUCTION

The notion of derivations on semirings has been introduced [1] by Jonathan Golan. Motivated by this, Chandramouleeswaran and Thiruveni [2] studied the notion of derivations on semirings. A Classical result of Herstein [3] asserts that any Jordan derivation on a 2-torsion free prime ring is a derivation. A brief proof of Herstein's theorem can be found in [4]. Cusack [5] generalized Herstein's theorem to a 2-torsion free semiprime ring[6]. In 1990, Bresar and Vukman [7] have introduced the notion of left derivation in rings, and also they introduced the notion of generalized derivations on rings. Ashraf and Ali in [8] introduced the definitions of generalized left derivation (generalized Jordan left derivation) if there exists a Jordan left derivation on a ring. Motivated by this, Chandramouleeswaran and Nirmala Devi [9] discussed the notion of left derivation, generalized left derivation on semirings and also Chandramouleeswaran and Nirmala Devi [10] introduced the notion of right derivations on semirings. Motivated by this, in our work, we introduce the notion of Generalized Jordan right derivation associated with right (Jordan right) derivation on semirings and we prove some elegant results.

## 2. PRELIMINARIES

In this section, we recall some basic definitions and results that are required for our work.

**Definition 2.1:** A semiring is a nonempty set  $S$  on which two binary operations of addition  $+$  and multiplication  $\cdot$  have been defined such that the following conditions are satisfied:

1.  $(S, +)$  is a monoid with identity element  $0$ ;
2.  $(S, \cdot)$  is a monoid with identity element  $1_S$ ;
3. Multiplication distributes over addition from either side:

$$a \cdot (b + c) = a \cdot b + a \cdot c; (b + c) \cdot a = b \cdot a + c \cdot a \quad \forall a, b, c \in S$$

4.  $0 \cdot s = 0 = s \cdot 0$  for all  $s \in S$ .

**Definition 2.2:** A Semiring  $(S, +, \cdot)$  is said to be additively commutative, if  $(S, +)$  is a commutative semigroup.

A Semiring  $(S, +, \cdot)$  is said to be multiplicatively commutative, if  $(S, \cdot)$  is a commutative semigroup.

The Semiring  $S$  is said to be a commutative semiring, if both additively and multiplicatively commutative.

**Definition 2.3:** A Semiring  $(S, +, \cdot)$  is additively cancellative, if it is both additively left and right cancellative.

A Semiring  $(S, +, \cdot)$  is a multiplicatively cancellative, if it is both multiplicatively left and right cancellative.

**Definition 2.4:** Let  $S$  be a semiring. A semiring  $S$  is said to be 2-torsion free, if  $2a = 0$ , with  $a \in S \implies a = 0$ .

**Definition 2.5:** Let  $S$  be a semiring. A right  $S$ - semimodule is a commutative monoid  $(X, +)$  with additive identity  $0_x$  for which we have a function  $X \times S \rightarrow X$ , denoted by  $(x, s) \rightarrow xs$  and called scalar multiplication, which satisfies the following conditions.

For all elements  $s$  and  $s'$  of  $S$  and all elements  $x$  and  $x'$  of  $X$ :

1.  $x(ss') = (xs)s'$
2.  $(x + x')s = xs + x's$
3.  $x(s + s') = xs + xs'$
4.  $x1_s = x$ .

**Definition 2.6:** Let  $S$  be a semiring. An additive mapping  $d: S \rightarrow S$  is called a derivation on  $S$ ,

$$\text{if } d(xy) = d(x)y + x d(y) \quad \forall x, y \in S.$$

Let  $S$  be a semiring. An additive mapping  $d: S \rightarrow S$  is called a Jordan derivation on  $S$ , if  $d(x^2) = d(x)x + x d(x) \quad \forall x \in S$ .

**Definition 2.7:** Let  $S$  be a semiring. An additive mapping  $F: S \rightarrow S$  is called a generalized derivation, if there exists a derivation  $d: S \rightarrow S$  such that  $F(xy) = F(x)y + x d(y) \quad \forall x, y \in S$ .

Let  $S$  be a semiring. An additive mapping  $F: S \rightarrow S$  is called a generalized Jordan derivation, if there exists a Jordan derivation  $d: S \rightarrow S$  such that  $F(x^2) = F(x)x + x d(x) \quad \forall x \in S$ .

### 3. JORDAN RIGHT DERIVATION:

In this section, we discuss the notion of Jordan right derivation on semirings.

**Definition 3.1:** Let  $S$  be a semiring and  $X$  a  $S$ -module. An additive mapping  $d_R: S \rightarrow X$  is called a Jordan right derivation on  $S$ , if  $d_R(x^2) = 2 d_R(x)x \quad \forall x \in S$ .

**Example 3.2:**

Let  $S = \left\{ \begin{pmatrix} a & b \\ 0 & a \end{pmatrix} : a, b \in \mathbb{Z}^+ \right\}$  be a commutative semiring

and  $X = \left\{ \begin{pmatrix} a & b \\ 0 & a \end{pmatrix} : a, b \in \mathbb{Z} \right\}$  a  $S$ -module.

Define a map  $d_R: S \rightarrow X$  given by  $d_R \left( \begin{pmatrix} a & b \\ 0 & a \end{pmatrix} \right) = \begin{pmatrix} 0 & b \\ 0 & 0 \end{pmatrix}$

Then  $d_R$  is a Jordan right derivation on  $S$ .

**Lemma 3.3:** Let  $(S, +, \cdot)$  be an additively commutative semiring. Then the sum of two Jordan

right derivation on  $S$  is again a Jordan right derivation.

**Proof:**

Let  $S$  be an additively commutative semiring.

Let  $d_{R1}, d_{R2} : S \rightarrow X$  be two Jordan right derivation.

**Claim:**  $d_{R1} + d_{R2}$  is a Jordan right derivation on  $S$ .

$$\begin{aligned} (d_{R1} + d_{R2})(x^2) &= (d_{R1})(x^2) + (d_{R2})(x^2) \\ &= 2 d_{R1}(x) x + 2 d_{R2}(x) x \quad \forall x \in S. \\ &= 2 (d_{R1}(x) + d_{R2}(x))x \quad \forall x \in S. \\ (d_{R1} + d_{R2})(x^2) &= 2 (d_{R1} + d_{R2})(x)x \quad \forall x \in S. \end{aligned}$$

$\therefore d_{R1} + d_{R2}$  is a Jordan right derivation on  $S$ .

#### 4. GENERALIZED JORDAN RIGHT DERIVATION:

In this section, we discuss the notion of generalized Jordan right derivation associated with right

(Jordan right) derivation on semirings and prove some elegant results.

**Definition 4.1:** Let  $S$  be a semiring and  $X$  a  $S$ -module. An additive mapping  $F_R : S \rightarrow X$  is called a **generalized right derivation associated with right derivation**, if there exists a right derivation  $d_R : S \rightarrow X$  such that  $F_R(xy) = F_R(x)y + d_R(y)x \quad \forall x, y \in S$ .

**Example 4.2:**

Let  $S = \left\{ \begin{pmatrix} 0 & 0 & 0 \\ a & 0 & 0 \\ b & c & 0 \end{pmatrix} : a, b, c \in \mathbb{Z}^+ \right\}$  be a semiring

and  $X = \left\{ \begin{pmatrix} 0 & 0 & 0 \\ a & 0 & 0 \\ b & c & 0 \end{pmatrix} : a, b, c \in \mathbb{Z} \right\}$  a  $S$ -module.

Define a map  $F_R : S \rightarrow X$  such that  $F_R \left( \begin{pmatrix} 0 & 0 & 0 \\ a & 0 & 0 \\ b & c & 0 \end{pmatrix} \right) = \begin{pmatrix} 0 & 0 & 0 \\ a & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad \forall a, b, c \in \mathbb{Z}^+$ .

Then there exists a right derivation  $d_R : S \rightarrow X$  such that

$$d_R \left( \begin{pmatrix} 0 & 0 & 0 \\ a & 0 & 0 \\ b & c & 0 \end{pmatrix} \right) = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ b & 0 & 0 \end{pmatrix} \quad \forall a, b, c \in \mathbb{Z}^+.$$

Then  $F_R$  is a generalized right derivation associated with right derivation on  $S$ .

**Definition 4.3:** Let  $S$  be a semiring and  $X$  a  $S$ -module. An additive mapping  $F_R : S \rightarrow X$  is called a **generalized right derivation associated with Jordan right derivation**, if there exists a Jordan right derivation  $d_R : S \rightarrow X$  such that  $F_R(xy) = F_R(x)y + d_R(y)x \quad \forall x, y \in S$ .

**Example 4.4:**

Let  $S = \left\{ \begin{pmatrix} 0 & a & b \\ 0 & 0 & a \\ 0 & 0 & 0 \end{pmatrix} : a, b \in \mathbb{Z}^+ \right\}$  be a semiring

and  $X = \left\{ \begin{pmatrix} 0 & a & b \\ 0 & 0 & a \\ 0 & 0 & 0 \end{pmatrix} : a, b \in \mathbb{Z} \right\}$  a  $S$ -module.

Define a map  $F_R : S \rightarrow X$  such that

$$F_R \left( \begin{pmatrix} 0 & a & b \\ 0 & 0 & a \\ 0 & 0 & 0 \end{pmatrix} \right) = \begin{pmatrix} 0 & 0 & b \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad \forall a, b \in \mathbb{Z}^+.$$

Then there exists a Jordan right derivation  $d_R : S \rightarrow X$  such that

$$d_R \left( \begin{pmatrix} 0 & a & b \\ 0 & 0 & a \\ 0 & 0 & 0 \end{pmatrix} \right) = \begin{pmatrix} 0 & a & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad \forall a, b \in \mathbb{Z}^+.$$

Then  $F_R$  is a generalized right derivation associated with Jordan right derivation on  $S$ .

**Definition 4.5:** Let  $S$  be a semiring and  $X$  a  $S$ -module. An additive mapping  $F_R : S \rightarrow X$  is called a generalized Jordan right derivation associated with right derivation, if there exists a right derivation  $d_R : S \rightarrow X$  such that  $F_R(x^2) = F_R(x)x + d_R(x)x \quad \forall x \in S$ .

**Definition 4.6:** Let  $S$  be a semiring and  $X$  a  $S$ -module. An additive mapping  $F_R : S \rightarrow X$  is called a generalized Jordan right derivation associated with Jordan right derivation, if there exists a Jordan right derivation  $d_R : S \rightarrow X$  such that  $F_R(x^2) = F_R(x)x + d_R(x)x \quad \forall x \in S$ .

**Example 4.7:** The mappings  $F_R$  and  $d_R$  given in example 4.4, are generalized Jordan right derivation associated with right (Jordan right) derivation on the given semiring.

**Remark 4.8:** Every generalized right derivation associated with Jordan right derivation on a Semiring  $S$  is a generalized Jordan right derivation associated with Jordan right derivation but the converse need not be true.

**Lemma 4.9:** Let  $(S, +, \cdot)$  be an additively commutative semiring. Sum of two generalized right derivation associated with Jordan right derivation on  $S$  is again a generalized right derivation associated with Jordan right derivation.

**Proof:** Let  $S$  be an additively commutative semiring. Let  $F_{R1}, F_{R2} : S \rightarrow X$  be a generalized right derivation associated with Jordan right derivation.

**To prove:**  $F_{R1} + F_{R2}$  is a generalized right derivation associated with Jordan right derivation

$$\begin{aligned} F_{R1}(xy) + F_{R2}(xy) &= F_{R1}(x)y + d_{R1}(y)x + F_{R2}(x)y + d_{R2}(y)x \\ &= (F_{R1} + F_{R2})(x)y + (d_{R1} + d_{R2})(y)x \end{aligned}$$

$$F_{R1}(xy) + F_{R2}(xy) = (F_{R1} + F_{R2})(x)y + (d_{R1} + d_{R2})(y)x$$

∴  $F_{R1} + F_{R2}$  is a generalized right derivation associated with Jordan right derivation.

**Lemma 4.10:** Let  $(S, +, \cdot)$  be an additively commutative semiring. Sum of two generalized Jordan right derivation associated with Jordan right derivation on  $S$  is again a generalized Jordan right derivation associated with Jordan right derivation.

**Proof:** Let  $S$  be an additively commutative semiring.

Let  $F_{R1}, F_{R2} : S \rightarrow X$  be a generalized Jordan right derivation associated with Jordan right derivation.

**To prove:**  $F_{R1} + F_{R2}$  is a generalized Jordan right derivation associated with Jordan right derivation.

$$\begin{aligned} (F_{R1} + F_{R2})(x^2) &= F_{R1}(x^2) + F_{R2}(x^2) \\ &= F_{R1}(x)x + d_{R1}(x)x + F_{R2}(x)x + d_{R2}(x)x \\ &= (F_{R1} + F_{R2})(x)x + (d_{R1} + d_{R2})(x)x \end{aligned}$$

∴  $F_{R1} + F_{R2}$  is a generalized Jordan right derivation associated with Jordan right derivation.

**Lemma 4.11:** Let  $S$  be a multiplicatively cancellative semiring. Suppose that  $a \in S$  such that  $(ax)a = (xa)a \forall x \in S$ , then  $a \in Z(S)$ .

**Proof:** Let  $S$  be a multiplicatively cancellative semiring.

**Claim:**  $a \in Z(S)$

Suppose  $(ax)a = (xa)a \forall x \in S$ ..... (1) Replace  $x$  by  $xr$  in (1), we get

$$(a(xr))a = ((xr)a)a \quad \forall x \in S$$

$$(ax)ra = (xa)ra \quad \text{..... (2)}$$

Since  $S$  is a multiplicatively cancellative semiring,  $ax = xa, \forall x \in S$

∴  $a \in Z(S)$

**Theorem 4.12:** Let  $S$  be a 2-torsion free prime semiring. Let  $X$  be a  $S$ -module such that  $aSx = 0 \Rightarrow a = 0$  or  $x = 0 \forall a \in S, x \in X$ . If  $S$  admits a generalized right derivation  $F_R$  associated with a non zero Jordan right derivation  $d_R$ , then  $S$  is commutative.

# CONNECTED BOUNDARY WEIGHT DOMINATION ON S-VALUED GRAPHS

**A. Arul Devi**

Sri Ramanas College Of Arts And Science For Women  
Chidhambarapuram, Tamilnadu. India.  
E-Mail: [aruldevika.22@gmail.com](mailto:aruldevika.22@gmail.com).

**Abstract:** *In the year 2015, Chandramouleeswaran and others introduced the notion of semiring valued graphs (briefly called S-valued graphs). In the same year, Jeyalakshmi, in her work, discussed the concept of vertex domination of S-valued graphs. K.M. Kathiresan, G.Marimuthu and M. Sivanantha Saraswathi, introduced the boundary domination in graphs. Mohammed Alatif, Putaswamy and Nayaka introduced the concept of connected boundary domination in graphs. Motivated by this, in this paper, we discuss the Connected Boundary Weight Domination On S-Valued Graphs.*

**Keywords:** *S – Valued graphs, Weight domination, Boundary neighbourhood, Boundary degree, Boundary domination number , Connected boundary weight domination number.*

**AMS Classification:** *16Y60,05C25,05C76*

## 1. INTRODUCTION :

P Sampathkumar and Walikar introduced the concept of connected domination in graphs[14]. Kathiresan and others introduced the concept of boundary domination in graphs[9]. Putaswamy and Mohammed introduced the concept of boundary edge domination in graphs[13]. Mohammed Alatif, Putaswamy and Nayaka introduced the concept of connected boundary domination in graphs[12]. Chandramouleeswaran and others introduced the concept of S-valued graphs[13]. Jeyalakshmi and Chandramouleeswaran introduced the concept of vertex domination in S-valued graphs[4]. Mangalalavanya and Chandramouleeswaran introduced the concept of edge domination in S-valued graphs[10]. Arul Devi and Thiruveni introduced the concept of Boundary weight domination on S-valued graphs[1]. In this paper we introduce the concept of Connected boundary weight domination on S-valued graphs.

## 2. PRELIMINARIES :

### Definition 2.1. [9]

Let  $G$  be a simple graph  $G=(V, E)$  with vertex set  $V(G) = \{v_1, v_2, \dots, v_n\}$ . For  $i \neq j$ , a vertex  $v_i$  is a boundary vertex of  $v_j$  if  $d(v_i, v_t) \leq d(v_j, v_t)$  for all  $v_t \in N(v_i)$ . A vertex  $v$  is called a boundary neighbour of  $u$  if  $v$  is a nearest boundary of  $u$ . If  $u \in V$ , then the boundary neighbourhood of  $u$  denoted by  $N_b(u)$  is defined as  $N_b(u) = \{v \in V : d(u, w) \leq d(u, v) \text{ for all } w \in N(u)\}$

### Definition 2.2 [6]

A subset  $S$  of  $V(G)$  is called a boundary dominating set if every vertex of  $V-S$  is boundary dominated by some vertex of  $S$ . The minimum taken over all boundary dominating sets of a graph  $G$  is called the boundary domination number on  $G$  and is denoted by  $\gamma_b(G)$ .

**Definition 2.3.[8]**

A boundary dominating set  $S$  of a connected graph  $G$  is called the connected boundary dominating set if the induced subgraph  $\langle S \rangle$  of  $G$  is connected. The minimum cardinality of a cb-set is called the connected boundary domination number  $\gamma_{cb}(G)$ .

**Definition 2.4 [6]**

Let  $G^S = (V, E, \sigma, \psi)$  be a  $S$ -valued graph by  $V_S$  mean the set  $V \times S$  and  $E_S$  mean the set  $E \times S$  any element of  $V_S$  will be denoted by  $v_i(s_i)$  where  $v_i \in V$  and  $s_i \in S$  for all  $i = 1, 2, \dots, n$ . Similarly, any element of  $E_S$  will be denoted by  $e_i^j(s_{i,j})$  where  $e_i^j = (v_i, v_j) \in E$  and  $s_{ij} = \min\{s_i, s_j\}$ .

**Definition 2.5 [4]**

Consider the  $S$ -valued graph  $G^S = (V_S, E_S)$ . where  $V_S = \{v_i(s_i) | v_i \in V \text{ and } s_i \in S\}$  and  $E_S = \{e_i^j(s_{i,j})\}$

- The order of  $G^S$  is defined as  $p_S = (|V_S|, |V|)$
- The size of  $G^S$  is defined as  $q_S = (|E_S|, |E|)$
- The open neighbourhood of  $v_i$  in  $G^S$  is defined as  $N_S(v_i) = \{(v_j, \sigma(v_j)) | (v_i, v_j) \in E, \psi(v_i, v_j) \in S\}$ .
- The closed neighbourhood of  $v_i$  in  $G^S$  is defined as  $N_S[v_i] = N_S(v_i) \cup \{v_i, \sigma(v_i)\}$ .

Analogously, we can define the open(closed) neighbourhood of an edge in  $G^S$ .

**Definition 2.6:[1]**

Consider the  $S$ -valued graph  $G^S = (V_S, E_S)$  where  $V_S = \{v_1(s_1), v_2(s_2), \dots, v_n(s_n)\}$ . For  $i \neq j$ , a vertex  $v_i(s_i)$  is said to be a boundary vertex of  $v_j(s_j)$  if  $dist_S(v_i(s_i), v_t(s_t)) \leq dist_S(v_j(s_j), v_t(s_t))$  for all  $v_t(s_t) \in N_S(v_j(s_j))$ .

**Definition 2.7:[1]**

Consider the  $S$ -valued graph  $G^S = (V_S, E_S)$  where  $V_S = \{v_1(s_1), v_2(s_2), \dots, v_n(s_n)\}$ . A vertex  $v_i(s_i) \in V_S$  is called boundary neighbour of a vertex  $v_j(s_j) \in V_S$  if  $v_i(s_i)$  is a nearest boundary of  $v_j(s_j)$ . If  $v_j(s_j) \in V_S$ , then the boundary neighbourhood of  $v_j(s_j)$ , denoted by  $bN_S(v_j(s_j))$ , is defined to be the set  $bN_S(v_j(s_j)) = \{v_i(s_i) \in V_S | dist_S(v_i(s_i), v_t(s_t)) \leq dist_S(v_j(s_j), v_t(s_t)) \text{ for all } v_t(s_t) \in N_S(v_j(s_j))\}$ .

**Definition 2.8:[1]**

The boundary degree of a vertex  $v_j(s_j) \in V_S$ , denoted by  $bdeg_S(v_j(s_j)) = (|bN_S(v_j(s_j))|_S, |bN_S(v_j(s_j))|)$ . The maximum and minimum boundary degree of the graph  $G^S$  are denoted respectively be,

$$\Delta_S^b(G^S) = \max_{v_j(s_j) \in V_S} (|bN_S(v_j(s_j))|_S, |bN_S(v_j(s_j))|)$$

$$\delta_S^b(G^S) = \min_{v_j(s_j) \in V_S} (|bN_S(v_j(s_j))|_S, |bN_S(v_j(s_j))|)$$

**Definition 2.9:[1]** A vertex  $v_j(s_j)$  is said to be a boundary weight dominating vertex of a vertex  $v_i(s_i)$  if  $v_i(s_i)$  is a boundary neighbour of  $v_j(s_j)$ . A subset  $D_S \subseteq V_S$  is called boundary weight dominating set if every vertex  $V_S - D_S$  is boundary weight dominated by some vertex of  $D_S$ . The minimum cardinality of all boundary weight dominating set of a graph  $G^S$  is called boundary weight domination number of  $G^S$  and is denoted by  $\gamma_b^S(G^S)$ .

### 3. CONNECTED BOUNDARY WEIGHT DOMINATION ON S-VALUED GRAPHS

In this section we introduce the notion of connected boundary weight domination in S-valued graphs.

**Definition 3.1:**

A boundary weight dominating set  $D^S$  of a connected S-valued graph  $G^S$  is called the connected boundary weight dominating set, if the induced subgraph  $\langle H^S \rangle$  of  $G^S$  is connected. The minimum cardinality of a connected boundary weight dominating set is called the connected boundary weight domination number, and it is denoted by  $\gamma_{cb}^S(G^S)$ .

**Example 3.2:**

Consider the semiring  $S = (\{0, a, b, c, d, e\}, +, \cdot, \preceq)$  with the following Cayley tables.

+	0	a	b	c	d	e	·	0	a	b	c	d	e	⪯	Elements of S
0	0	a	b	c	d	e	0	0	0	0	0	0	0	0	0, a, b, c, d, e
a	a	a	b	c	d	e	a	0	0	0	a	a	e	a	a, b, c, d, e
b	b	b	b	d	d	e	b	0	a	b	a	b	b	b	b, d, e
c	c	c	d	c	d	e	c	0	0	0	c	c	e	c	c, d, e
d	d	d	d	d	d	e	d	0	a	b	c	d	e	d	d, e
e	e	e	e	e	e	e	e	0	c	e	c	e	e	e	e

Consider the S-valued graph  $G^S = (V_S, E_S)$ ,

One can easily verify that the boundary degree of each vertices of  $G^S$  as follows:

$$bdeg_S(v_1(e)) = (e, 2), bdeg_S(v_2(d)) = (d, 2), bdeg_S(v_3(e)) = (e, 2),$$

$$bdeg_S(v_4(a)) = (e, 3), bdeg_S(v_5(d)) = (e, 3), bdeg_S(v_6(d)) = (d, 2)$$

$H^S = \{v_3(e), v_2(d), v_6(d)\}$  is a connected boundary weight dominating vertex set.

The minimum cardinality of a connected boundary weight dominating set of  $\gamma_{cb}^S(G^S) = (e, 3)$

The maximum degree of  $G^S$  is  $\Delta_S^b(G^S) = (e, 3)$  and minimum degree of  $G^S$  is  $\gamma_{cb}^S(G^S) = (d, 2)$

**Theorem 3.6:**

For any path  $P_n^S, n \geq 3$ , the boundary weight dominating vertex number is  $\gamma_b^S(P_n^S) = (|D|_S, n - 2)$ .

**Proof:** Consider the path  $P_3^S$  is given by,  $v_1(s_1), e_1^2(s_{12}), v_2(s_2), e_2^3(s_{23}), v_3(s_3)$ .

$$P_{v_1v_2}^S = \{v_1(s_1), e_1^2(s_{12}), v_2(s_2)\}. w(P_{v_1v_2}^S) = \sum \psi(e_1^2) = \psi(e_1^2) \text{ and } l(P_{v_1v_2}^S) = 1.$$

$$P_{v_1v_3}^S = \{v_1(s_1), e_1^2(s_{12}), v_2(s_2), e_2^3(s_{23}), v_3(s_3)\}. w(P_{v_1v_3}^S) = \sum \psi(e_1^2) + \psi(e_2^3) \text{ and } l(P_{v_1v_3}^S) = 2.$$

$$dist_S(v_1(s_1), v_2(s_2)) = \min\{w(P_{v_1v_2}^S), l(P_{v_1v_2}^S)\} = (\psi(e_1^2), 1);$$

$$dist_S(v_1(s_1), v_3(s_3)) = \min\{w(P_{v_1v_3}^S), l(P_{v_1v_3}^S)\} = (\psi(e_1^2) + \psi(e_2^3), 2);$$

$$P_{v_2v_3}^S = \{v_2(s_2), e_2^3(s_{23}), v_3(s_3)\}. w(P_{v_2v_3}^S) = \sum \psi(e_2^3) = \psi(e_2^3) \text{ and } l(P_{v_2v_3}^S) = 1.$$

$$dist_S(v_2(s_2), v_3(s_3)) = \min\{w(P_{v_2v_3}^S), l(P_{v_2v_3}^S)\} = (\psi(e_2^3), 1)$$

Let  $D^S = \{v_2(s_2)\}$ . Then  $V_S - D_S = \{v_1(s_1), v_2(s_2), v_3(s_3)\}$  is boundary weight dominated by  $D^S$ . If every vertex  $D^S$  is a connected boundary weight dominating vertex set.

Therefore  $\gamma_{cb}^S(P_n^S) = (|D^S|_S, |D^S|) = (\sigma(v_2), 1) = (|D^S|_S, 1)$ . where  $n = 3$ .

We know that, a vertex  $v_i(s_i)$  will dominate  $v_{i-1}(s_{i-1})$  and  $v_{i+1}(s_{i+1})$  in any path  $P_n^S$ , where  $n = 3$ . Proceeding like this, the connected boundary weight domination number of the S-valued path  $\gamma_b^S(P_4^S) = (|D^S|_S, 2)$ . In general, the connected boundary weight domination number of the S-valued path  $\gamma_b^S(P_n^S) = (|D^S|_S, n - 2)$ . where  $n \geq 5$ , where  $D^S$  is a connected boundary weight dominating vertex set.

**Theorem. 3.7:**

For any complete S-valued graph,  $K_n^S, n \geq 4$ , the connected boundary weight dominating vertex number is

$$\gamma_b^S(K_n^S) = (|D_S|_S, 1).$$

**Proof:** Consider the complete graph  $K_n^S$ , is given by the path,

$$v_1(s_1), e_1^2(s_{12}), v_2(s_2), e_2^3(s_{23}), v_3(s_3), e_3^4(s_{34}), v_4(s_4), e_4^2(s_{42}), v_2(s_2), e_1^2(s_{12}), v_1(s_1), e_1^3(s_{13}), v_3(s_3)$$

$$P_{v_1v_2}^S = \{v_1(s_1), e_1^2(s_{12}), v_2(s_2), v_1(s_1), e_1^3(s_{13}), v_3(s_3), e_2^3(s_{23}), e_3^4(s_{34}), v_2(s_2), v_1(s_1), e_1^4(s_{14}), v_4(s_4), e_3^4(s_{34}), v_3(s_3), e_2^3(s_{23}), v_4(s_4), v_2(s_2)\}$$

$$w(P_{v_1v_2}^S) = \{\psi(e_1^2) + \psi(e_1^3) + \psi(e_1^4) + \psi(e_2^3) + \psi(e_3^4)\} \text{ and } l(P_{v_1v_2}^S) = \min(1, 2, 3) = 1$$

$$P_{v_1v_3}^S = \{v_1(s_1), e_1^3(s_{13}), v_3(s_3), v_1(s_1), e_1^4(s_{14}), v_4(s_4), e_3^4(s_{34}), v_3(s_3),$$

$$v_1(s_1), e_1^2(s_{12}), v_2(s_2), e_2^3(s_{23}), v_3(s_3)\}$$

$$w(P_{v_1v_3}^S) = \{\psi(e_1^3) + \psi(e_1^4) + \psi(e_3^4) + \psi(e_2^3) + \psi(e_1^2)\} \text{ and } l(P_{v_1v_3}^S) = \min(1, 2, 3) = 1$$

$$P_{v_1v_4}^S = \{v_1(s_1), e_1^4(s_{14}), v_4(s_4), v_1(s_1), e_1^3(s_{13}), v_3(s_3), e_3^4(s_{34}), v_4(s_4),$$

$$v_1(s_1), e_1^2(s_{12}), v_2(s_2), e_2^3(s_{23}), v_3(s_3), e_3^4(s_{34}), v_4(s_4)\}$$

$$w(P_{v_1v_4}^S) = \{\psi(e_1^4) + \psi(e_1^3) + \psi(e_3^4) + \psi(e_2^3) + \psi(e_1^2)\} \text{ and } l(P_{v_1v_4}^S) = \min(1, 2, 3) = 1$$

$$\begin{aligned} \text{dist}_S(v_1(s_1), v_2(s_2)) &= \min(\psi(e_1^2) + \psi(e_1^3) + \psi(e_1^3) + \psi(e_2^3) + \psi(e_3^4), 1); \\ \text{dist}_S(v_1(s_1), v_3(s_3)) &= \min(\psi(e_1^3) + \psi(e_1^4) + \psi(e_4^3) + \psi(e_1^2) + \psi(e_2^3), 1); \\ \text{dist}_S(v_1(s_1), v_4(s_4)) &= \min(\psi(e_1^4) + \psi(e_1^3) + \psi(e_3^4) + \psi(e_1^2) + \psi(e_2^3), 1). \\ bN_S(v_1(s_1)) &= \{v_2(s_2), v_3(s_3), v_4(s_4)\}; bdegN_S(v_1(s_1)) = \{s_2 + s_3 + s_4, 3\} \end{aligned}$$

Let  $D_{1S} = \{v_1(s_1)\}$ ,  $V_S - D_{1S} = \{v_2(s_2), v_3(s_3), v_4(s_4)\}$ . Every vertex in  $V_S - D_{1S}$  is dominated by  $D_{1S}$ ,  $D_{1S}$  is a connected boundary weight dominating vertex set provided  $\sigma(s_1) = s_1, s_2, s_3, s_4 \leq s_1, \gamma_b^S(D_{1S}) = (|D_{1S}|_S, 1)$ .

Proceeding like this, we can find the other vertices of the bounded neighbourhood is,  $bN_S(v_2(s_2)) = \{v_1(s_1), v_3(s_3), v_4(s_4)\}; bdegN_S(v_2(s_2)) = \{s_1 + s_3 + s_4, 3\}$

Let  $D_{2S} = \{v_2(s_2)\}$ ,  $V_S - D_{2S} = \{v_1(s_1), v_3(s_3), v_4(s_4)\}$ . Every vertex in  $V_S - D_{2S}$  is dominated by  $D_{2S}$ ,  $D_{2S}$  is a connected boundary weight dominating vertex set provided  $\sigma(s_2) = s_1, s_2, s_3, s_4 \leq s_2, \gamma_b^S(D_{2S}) = (|D_{2S}|_S, 1)$ .

$bN_S(v_3(s_3)) = \{v_2(s_2), v_1(s_1), v_4(s_4)\}; bdegN_S(v_3(s_3)) = \{s_1 + s_2 + s_4, 3\}$

Let  $D_{3S} = \{v_3(s_3)\}$ ,  $V_S - D_{3S} = \{v_1(s_1), v_2(s_2), v_4(s_4)\}$ . Every vertex in  $V_S - D_{3S}$  is dominated by  $D_{3S}$ ,  $D_{3S}$  is a connected boundary weight dominating vertex set provided  $\sigma(s_3) = s_1, s_2, s_3, s_4 \leq s_3, \gamma_b^S(D_{3S}) = (|D_{3S}|_S, 1)$ .

$bN_S(v_4(s_4)) = \{v_2(s_2), v_1(s_1), v_3(s_3)\}; bdegN_S(v_4(s_4)) = \{s_1 + s_2 + s_3, 3\}$

Let  $D_{4S} = \{v_4(s_4)\}$ ,  $V_S - D_{4S} = \{v_1(s_1), v_2(s_2), v_3(s_3)\}$ . Every vertex in  $V_S - D_{4S}$  is dominated by  $D_{4S}$ ,  $D_{4S}$  is a connected boundary weight dominating vertex set provided  $\sigma(s_4) = s_1, s_2, s_3, s_4 \leq s_4, \gamma_b^S(D_{4S}) = (|D_{4S}|_S, 1)$ .

Thus we conclude that for  $K_4^S$ , then the set  $D_S = \{v_i(s_i)\}$  will be a connected boundary weight dominating vertex set if  $s_j \leq s_i$ , for all  $i \neq j$ .

Since any vertex in a complete graph  $K_n^S$  will be dominated all vertices preceding as above we conclude that  $\gamma_{cb}^S(K_n^S) = (|D^S|_S, 1)$  for some  $s_i \in S$  such that  $s_j \leq s_i$ , for all  $i \neq j$

### Theorem 3.8:

For any complete bipartite S-valued graph, then the connected boundary weight dominating vertex number  $\gamma_{cb}^S(K_{mn}^S) = (|D^S|_S, 2)$ .

#### Proof:

Let  $V_{1S}$  and  $V_{2S}$  be partition of the vertex set of  $K_{mn}^S$ . Let Then  $v_1(s_1) \in V_{1S}$ . Then  $\text{dist}_S(v_1(s_1), v_2(s_2)) = (\psi(e_1^2) + \psi(e_2^3), 2)$  for all  $v_2(s_2) \in V_{1S} - \{v_1(s_1)\}$  and every vertex  $v_2(s_2)$  in  $V_{1S}$  is a boundary vertex  $v_1(s_1)$  of except  $v_1(s_1)$ . Similarly if  $u_1(s_1) \in V_{2S}$ , then every vertex of  $v_2(s_2)$  is a connected boundary neighbour of  $u_1(s_1)$  except  $u_1(s_1)$ . Thus  $\gamma_{cb}^S(K_{mn}^S) = (|D^S|_S, 2)$ .

### Theorem 3.9:

Let  $T^S$  be a S-valued tree of order  $(|V|_S, n)$  with  $(|V_1|_S, n_1)$  pendent vertices. Then the connected boundary weight dominating vertex number is  $\gamma_{cb}^S(T^S) = (|D^S|_S, n - n_1)$ .

**Proof:** Let  $V_{1S}$  be the set of all pendent vertices of the tree  $T^S$  of order  $(|V|_S, n_1)$ . Then every vertex in  $V_S - V_{1S}$  has a maximum weight and boundary neighbor in  $V_{1S}$ . Then the connected boundary weight dominating vertex number is  $\gamma_{cb}^S(T^S) = (|D^S|_S, n - n_1)$ .

### Theorem 3.10:

For any connected S-valued graph  $G^S$ ,  $\gamma_b^S(G^S) \leq \gamma_{cb}^S(G^S)$ .

**Proof:**

Every connected boundary weight dominating set of a graph  $G^S$  is also a boundary weight dominating vertex set. The boundary weight dominating vertex set is need not be connected. So the minimum number of vertices are dominated by the graph  $G^S$ . But the connected boundary weight dominating vertex set must be connected.

Hence  $\gamma_b^S(G^S) \leq \gamma_{cb}^S(G^S)$ .

**4. CONCLUSION:**

In this paper, we have studied the notion of connected boundary weight dominating vertex sets and connected boundary weight dominating vertex number of S-valued graphs. Further, we have introduced the notion of connected boundary weight dominating polynomials of a given S-valued graphs and determined the same for certain class of S-valued graphs. In future, we have proposed to study the boundary edge weight domination on S-valued graphs and boundary edge weight domination number on S-valued graphs.

**ABSTRACT:** *In this article, the concept of intuitionistic fuzzy H-Ideals in Z-algebras is presented and some of their features are studied. The Z-homomorphic image and inverse image of intuitionistic fuzzy H-ideals in Z-algebras are examined. In addition, the Cartesian product of intuitionistic fuzzy H-ideals in Z-algebras is also investigated.*

**Keywords:** *Z-algebra, H-ideal, intuitionistic fuzzy H-ideal*

## 1. INTRODUCTION:

Imai and Iseki [4,5] introduced two new classes of abstract algebras: BCK-algebras and BCI-algebras. In 2017, Chandramouleeswaran et al.[3] introduced the concept of Z-algebras as a new structure of algebra based on propositional calculus. The Z-algebra is not a generalization of BCK/BCI-algebras. In 1965, Zadeh [8] introduced the fundamental concept of a fuzzy set which is a generalization of an ordinary set. In 1986, the idea of “intuitionistic fuzzy set” was first published by Atanassov [1], as a generalization of the notion of fuzzy set. In addition to the membership function, the idea of an intuitionistic fuzzy set also includes a non-membership function. Since then, other researchers have examined intuitionistic fuzzy structures in various algebras. In our earlier paper [7], we introduced fuzzy H-ideals in Z-algebras. In this article, we define the notion of intuitionistic fuzzy H-ideals in Z-algebras and investigated some of their properties.

## 2. PRELIMINARIES:

In this section we recall some basic definitions that are needed for our work.

**Definition 2.1[3]:** A Z-algebra  $(X,*,0)$  is a nonempty set X with a constant 0 and a binary operation \* satisfying the following conditions:

$$(Z1) \quad x * 0 = 0$$

$$(Z2) \quad 0 * x = x$$

$$(Z3) \quad x * x = x$$

$$(Z4) \quad x * y = y * x, \text{ when } x \neq 0 \text{ and } y \neq 0 \quad \forall x, y \in X.$$

**Definition 2.2[3]:** Let  $(X,*,0)$  be a Z-algebra and I be a subset of X. Then, I is called an **Z-ideal** of X, if it satisfies the following conditions: For all x, y in X,

$$i) \quad 0 \in I$$

$$ii) \quad x * y \in I \text{ and } y \in I \Rightarrow x \in I$$

**Definition 2.3[7]:** Let  $(X, *, 0)$  be a Z-algebra and  $I$  be a subset of  $X$ . Then,  $I$  is called an **H-ideal** of  $X$ , if it satisfies the following conditions: For all  $x, y, z$  in  $X$ ,

- i)  $0 \in I$
- ii)  $x * (y * z) \in I$  and  $y \in I \Rightarrow x * z \in I$

**Definition 2.4[3]:** Let  $(X, *, 0)$  and  $(Y, *, 0')$  be two Z-algebras. A mapping  $h : (X, *, 0) \rightarrow (Y, *, 0')$  is said to be a **Z-homomorphism** of Z-algebras if  $h(x * y) = h(x) *' h(y)$  for all  $x, y \in X$ .

**Definition 2.5[3]:** Let  $h : (X, *, 0) \rightarrow (Y, *, 0')$  be a Z-homomorphism of Z-algebras. Then

1.  $h$  is called a **Z-monomorphism** of Z-algebras if  $h$  is 1-1.
2.  $h$  is called an **Z-epimorphism** of Z-algebras if  $h$  is onto.
3.  $h$  is called an **Z-endomorphism** of Z-algebras if  $h$  is a mapping from  $(X, *, 0)$  into itself.

**Note :** If  $h : (X, *, 0) \rightarrow (Y, *, 0')$  is a Z-homomorphism then  $h(0) = 0'$ .

**Definition 2.6[1]:** Let  $X$  be a nonempty universal set. A fuzzy set  $A$  in  $X$  is characterized by a membership function  $\mu_A$  which associates with each point  $x$  in  $X$ , a real number  $\mu_A(x)$  in the interval  $[0, 1]$  with  $\mu_A(x)$  representing the “grade of membership” of  $x$  in  $A$ .

That is, a fuzzy set  $A$  in  $X$  is characterized by a membership function  $\mu_A : X \rightarrow [0, 1]$ .

**Definition 2.7[7]:** Let  $(X, *, 0)$  be a Z-algebra. A fuzzy set  $A$  in  $X$  with membership function  $\mu_A$  is said to be **fuzzy H-ideal** of a Z-algebra  $X$  if it satisfies the following conditions: For all  $x, y, z$  in  $X$ ,

- (i)  $\mu_A(0) \geq \mu_A(x)$
- (ii)  $\mu_A(x * z) \geq \min\{\mu_A(x * (y * z)), \mu_A(y)\}$

**Definition 2.8[1]:** An **Intuitionistic Fuzzy Set (IFS)**  $A$  in a nonempty set  $X$  is an object having the form  $A = \{\langle x, \mu_A(x), \beta_A(x) \rangle \mid x \in X\}$  where  $\mu_A : X \rightarrow [0, 1]$  denote the degree of membership and  $\beta_A : X \rightarrow [0, 1]$  denote the degree of non-membership functions such that for each  $x \in X$  to the set  $A$  with  $0 \leq \mu_A(x) + \beta_A(x) \leq 1$ . For the sake of simplicity, we shall use the symbol  $A = (\mu_A, \beta_A)$  for the IFS  $A = \{\langle x, \mu_A(x), \beta_A(x) \rangle \mid x \in X\}$ .

**Definition 2.9[1]:** If  $A = \{\langle x, \mu_A(x), \beta_A(x) \rangle \mid x \in X\}$  and  $B = \{\langle x, \mu_B(x), \beta_B(x) \rangle \mid x \in X\}$  be any two intuitionistic fuzzy set of a nonempty set  $X$ . Then,

1.  $A \subseteq B$  iff  $\mu_A(x) \leq \mu_B(x)$  and  $\beta_A(x) \geq \beta_B(x)$  for all  $x \in X$
2.  $A = B$  iff  $\mu_A(x) = \mu_B(x)$  and  $\beta_A(x) = \beta_B(x)$  for all  $x \in X$
3.  $A^c = \{\langle x, \beta_A(x), \mu_A(x) \rangle \mid x \in X\}$
4.  $A \cap B = \{\langle x, \mu_{A \cap B}(x), \beta_{A \cup B}(x) \rangle \mid x \in X\} = \{\langle x, \min(\mu_A(x), \mu_B(x)), \max(\beta_A(x), \beta_B(x)) \rangle \mid x \in X\}$
5.  $A \cup B = \{\langle x, \mu_{A \cup B}(x), \beta_{A \cap B}(x) \rangle \mid x \in X\} = \{\langle x, \max(\mu_A(x), \mu_B(x)), \min(\beta_A(x), \beta_B(x)) \rangle \mid x \in X\}$
6.  $\oplus A = (\mu_A, (\mu_A)^c) = \{\langle x, \mu_A(x), 1 - \mu_A(x) \rangle \mid x \in X\}$
7.  $\otimes A = ((\beta_A)^c, \beta_A) = \{\langle x, 1 - \beta_A(x), \beta_A(x) \rangle \mid x \in X\}$

$$8. \bigcap_{i \in \Omega} A_i = \left\{ \left\langle x, \mu_{\bigcap_{i \in \Omega} A_i}(x), \beta_{\bigcup_{i \in \Omega} A_i}(x) \right\rangle \mid x \in X \right\}$$

where  $\mu_{\bigcap_{i \in \Omega} A_i}(x) = \inf_{i \in \Omega} (\mu_{A_i}(x))$  and  $\beta_{\bigcup_{i \in \Omega} A_i}(x) = \sup_{i \in \Omega} (\beta_{A_i}(x))$ .

**Definition 2.10[2]:** Let  $A = (\mu_A, \beta_A)$  be an intuitionistic fuzzy set in a nonempty set  $X$ . For  $s, t \in [0,1]$ ,  $U(\mu_A; s) = \{x \in X \mid \mu_A(x) \geq s\}$  is called an **upper s-level subset of A** and  $L(\beta_A; t) = \{x \in X \mid \beta_A(x) \leq t\}$  is called the **lower t-level subset of A**.

**Definition 2.11[2]:** An IFS  $A$  in a set  $X$  with the degree of membership  $\mu_A : X \rightarrow [0,1]$  and the degree of non-membership  $\beta_A : X \rightarrow [0,1]$  is said to have **sup-inf property** if for any subset  $T$  of  $X$  there exists  $x_0 \in T$  such that  $\mu_A(x_0) = \sup_{t \in T} \mu_A(t)$  and  $\beta_A(x_0) = \inf_{t \in T} \beta_A(t)$ .

**Definition 2.12[6]:** Let  $h$  be any function from a set  $X$  into a set  $Y$ .

(i) Let  $A = \{\langle x, \mu_A(x), \beta_A(x) \rangle \mid x \in X\}$  be an intuitionistic fuzzy set in  $X$ . Then image of  $A$  under  $h$ , denoted by  $h(A) = \{\langle y, \mu_{h(A)}(y), \beta_{h(A)}(y) \rangle \mid y \in Y\}$  is an intuitionistic fuzzy set in  $Y$ , defined by:

$$\mu_{h(A)}(y) = \begin{cases} \sup_{z \in h^{-1}(y)} \mu_A(z) & \text{if } h^{-1}(y) = \{x \mid h(x) = y\} \neq \phi \\ 0 & \text{otherwise} \end{cases}$$

and

$$\beta_{h(A)}(y) = \begin{cases} \inf_{z \in h^{-1}(y)} \beta_A(z) & \text{if } h^{-1}(y) = \{x \mid h(x) = y\} \neq \phi \\ 0 & \text{otherwise} \end{cases}$$

(ii) Let  $B = \{\langle x, \mu_B(x), \beta_B(x) \rangle \mid x \in X\}$  be an intuitionistic fuzzy set in  $Y$ . The pre-image of  $B$  under  $h$ , symbolized by  $h^{-1}(B) = \{\langle x, \mu_{h^{-1}(B)}(x), \beta_{h^{-1}(B)}(x) \rangle \mid x \in X\}$  defined by:  $\mu_{h^{-1}(B)}(x) = \mu_B(h(x))$  and  $\beta_{h^{-1}(B)}(x) = \beta_B(h(x))$  for all  $x \in X$  is an intuitionistic fuzzy set of  $X$ .

**Definition 2.13[1]:** Let  $A = (\mu_A, \beta_A)$  and  $B = (\mu_B, \beta_B)$  be any two intuitionistic fuzzy sets of a nonempty set  $X$ . The Cartesian product  $A \times B$  is given by  $A \times B = (\mu_{A \times B}, \beta_{A \times B})$  with membership function  $\mu_{A \times B} : X \times X \rightarrow [0,1]$  and the non-membership function  $\beta_{A \times B} : X \times X \rightarrow [0,1]$  are defined by  $\mu_{A \times B}(x, y) = \min\{\mu_A(x), \mu_B(y)\}$  and  $\beta_{A \times B}(x, y) = \max\{\beta_A(x), \beta_B(y)\}$  for all  $x, y \in X$ .

### 3. INTUITIONISTIC FUZZY H-IDEALS IN Z-ALGEBRAS:

**Definition 3.1:** An intuitionistic fuzzy set  $A = (\mu_A, \beta_A)$  in a  $Z$ -algebra  $(X, *, 0)$  is called intuitionistic fuzzy H-ideal of  $X$  if it satisfies the following conditions:

- (i)  $\mu_A(0) \geq \mu_A(x)$  and  $\beta_A(0) \leq \beta_A(x)$
- (ii)  $\mu_A(x * z) \geq \min\{\mu_A(x * (y * z)), \mu_A(y)\}$

(iii)  $\beta_A(x * z) \leq \max\{\beta_A(x * (y * z)), \beta_A(y)\}$ , for all  $x, y, z \in X$

**Example 3.2:** Let  $X = \{0, 1, 2, 3\}$  be a set with the following Cayley table:

*	0	1	2	3
0	0	1	2	3
1	0	1	3	3
2	0	3	2	2
3	0	3	2	3

Then  $(X, *, 0)$  is a Z-algebra. Define an intuitionistic fuzzy set  $A = (\mu_A, \beta_A)$  in  $X$  as follows:

$$\mu_A(x) = \begin{cases} 0.6 & \text{if } x = 0 \\ 0.2 & \text{if } x = 1, 2, 3 \end{cases} \quad \text{and} \quad \beta_A(x) = \begin{cases} 0.3 & \text{if } x = 0 \\ 0.7 & \text{if } x = 1, 2, 3 \end{cases}$$

Then  $A$  is an intuitionistic fuzzy H-ideal of a Z-algebra  $X$ .

**Theorem 3.3:** Intersection of any two intuitionistic fuzzy H-ideals of a Z-algebra  $X$  is again an intuitionistic fuzzy H-ideal of  $X$ .

**Proof :** For every  $x, y, z \in X$

$$\mu_{A \cap B}(0) = \min\{\mu_A(0), \mu_B(0)\} \geq \min\{\mu_A(x), \mu_B(x)\} = \mu_{A \cap B}(x)$$

$$\beta_{A \cup B}(0) = \max\{\beta_A(0), \beta_B(0)\} \leq \max\{\beta_A(x), \beta_B(x)\} = \beta_{A \cup B}(x)$$

$$\begin{aligned} \mu_{A \cap B}(x * z) &= \min\{\mu_A(x * z), \mu_B(x * z)\} \\ &\geq \min\{\min\{\mu_A(x * (y * z)), \mu_A(y)\}, \min\{\mu_B(x * (y * z)), \mu_B(y)\}\} \\ &= \min\{\mu_{A \cap B}(x * (y * z)), \mu_{A \cap B}(y)\} \end{aligned}$$

$$\begin{aligned} \beta_{A \cup B}(x * z) &= \max\{\beta_A(x * z), \beta_B(x * z)\} \\ &\leq \max\{\max\{\beta_A(x * (y * z)), \beta_A(y)\}, \max\{\beta_B(x * (y * z)), \beta_B(y)\}\} \\ &= \max\{\beta_{A \cup B}(x * (y * z)), \beta_{A \cup B}(y)\} \end{aligned}$$

Hence  $A \cap B$  is an intuitionistic fuzzy H-ideal of a Z-algebra  $X$ .

We generalize the above theorem as follows.

**Theorem 3.4:** Let  $\{A_i \mid i \in \Omega\}$  be a family of intuitionistic fuzzy H-ideals of a Z-algebra  $X$ .

Then  $\bigcap_{i \in \Omega} A_i$  is an intuitionistic fuzzy H-Ideal of  $X$ .

By using the definition of  $A^c$ , we can prove the following result

**Lemma 3.5:** An IFS  $A = (\mu_A, \beta_A)$  is an intuitionistic fuzzy H-ideal of a Z-algebra  $X$  if and only if the fuzzy sets  $\mu_A$  and  $(\beta_A)^c$  are fuzzy H-ideals of  $X$ .

**Theorem 3.6:** Let  $A = (\mu_A, \beta_A)$  be an IFS in a Z-algebra  $X$ . Then  $A = (\mu_A, \beta_A)$  is an intuitionistic fuzzy H-ideal of  $X$  if and only if  $\oplus A = (\mu_A, (\mu_A)^c)$  and  $\otimes A = ((\beta_A)^c, \beta_A)$  are intuitionistic fuzzy H-ideals of  $X$ .

**Proof:** Let  $A = (\mu_A, \beta_A)$  be an intuitionistic fuzzy H-ideal of a Z-algebra  $X$ .

Let  $x, y, z \in X$ . Then,

$$(i) \quad \mu_A(0) \geq \mu_A(x) \quad \text{and} \quad \mu_A(x * z) \geq \min\{\mu_A(x * (y * z)), \mu_A(y)\}$$

$$(ii) \quad \beta_A(0) \leq \beta_A(x) \quad \text{and} \quad \beta_A(x * z) \leq \max\{\beta_A(x * (y * z)), \beta_A(y)\}$$

$$\begin{aligned}
\text{(iii)} \quad & (\mu_A)^c(0) = 1 - \mu_A(0) \leq 1 - \mu_A(x) = (\mu_A)^c(x) \\
\text{(iv)} \quad & (\mu_A)^c(x * z) = 1 - \mu_A(x * z) \leq 1 - \min\{\mu_A(x * (y * z)), \mu_A(y)\} \\
& = \max\{1 - \mu_A(x * (y * z)), 1 - \mu_A(y)\} \\
& = \max\{(\mu_A)^c(x * (y * z)), (\mu_A)^c(y)\}
\end{aligned}$$

$$\text{(v)} \quad (\beta_A)^c(0) = 1 - \beta_A(0) \geq 1 - \beta_A(x) = (\beta_A)^c(x)$$

$$\begin{aligned}
\text{(vi)} \quad & (\beta_A)^c(x * z) = 1 - \beta_A(x * z) \geq 1 - \max\{\beta_A(x * (y * z)), \beta_A(y)\} \\
& = \min\{1 - \beta_A(x * (y * z)), 1 - \beta_A(y)\} \\
& = \min\{(\beta_A)^c(x * (y * z)), (\beta_A)^c(y)\}
\end{aligned}$$

From (i), (iii) and (iv) we get  $\oplus A = (\mu_A, (\mu_A)^c)$  is an intuitionistic fuzzy H-ideal of a Z-algebra X.

And, from (ii), (v) and (vi) we get  $\otimes A = ((\beta_A)^c, \beta_A)$  is an intuitionistic fuzzy H-ideal of a Z-algebra X.

**Conversely**, assume that  $\oplus A = (\mu_A, (\mu_A)^c)$  and  $\otimes A = ((\beta_A)^c, \beta_A)$  are intuitionistic fuzzy H-ideals of a Z-algebra X. For any  $x, y, z \in X$ ,

$$\begin{aligned}
\text{(i)} \quad & \mu_A(0) \geq \mu_A(x) \text{ and } \beta_A(0) \leq \beta_A(x) \\
\text{(ii)} \quad & \mu_A(x * z) \geq \min\{\mu_A(x * (y * z)), \mu_A(y)\} \text{ and} \\
& \beta_A(x * z) \leq \max\{\beta_A(x * (y * z)), \beta_A(y)\}
\end{aligned}$$

Hence  $A = (\mu_A, \beta_A)$  is an intuitionistic fuzzy H-ideal of a Z-algebra X.

Analogously, we can prove the following result.

**Theorem 3.7:** An IFS  $A = (\mu_A, \beta_A)$  is an intuitionistic fuzzy H-ideal of a Z-algebra X if and only if for all  $s, t \in [0, 1]$ , the sets  $U(\mu_A; s)$  and  $L(\beta_A; t)$  are either empty or H-ideals of X.

**Theorem 3.8:** Let  $h$  be a homomorphism from a Z-algebra  $(X, *, 0)$  onto a Z-algebra  $(Y, *, 0')$  and  $A$  be an intuitionistic fuzzy H-ideal of X with sup-inf property. Then image of  $A$ ,  $h(A) = \left\{ \langle y, \mu_{h(A)}(y), \beta_{h(A)}(y) \rangle \mid y \in Y \right\}$  is an intuitionistic fuzzy H-ideal of Y.

**Proof:** Let  $a, b, c \in Y$  with  $x_0 \in h^{-1}(a)$ ,  $y_0 \in h^{-1}(b)$  and  $z_0 \in h^{-1}(c)$  such that

$$\begin{aligned}
\mu_A(x_0) &= \sup_{t \in h^{-1}(a)} \mu_A(t); \quad \mu_A(y_0) = \sup_{t \in h^{-1}(b)} \mu_A(t) \quad \text{and} \quad \mu_A(z_0) = \sup_{t \in h^{-1}(c)} \mu_A(t) \\
\beta_A(x_0) &= \inf_{t \in h^{-1}(a)} \beta_A(t); \quad \beta_A(y_0) = \inf_{t \in h^{-1}(b)} \beta_A(t) \quad \text{and} \quad \beta_A(z_0) = \inf_{t \in h^{-1}(c)} \beta_A(t)
\end{aligned}$$

Now,

$$\begin{aligned}
\text{(i)} \quad & \mu_{h(A)}(0') = \sup_{t \in h^{-1}(0')} \mu_A(t) \geq \mu_A(0) \geq \mu_A(x_0) = \sup_{t \in h^{-1}(a)} \mu_A(t) = \mu_{h(A)}(a) \\
\text{(ii)} \quad & \beta_{h(A)}(0') = \inf_{t \in h^{-1}(0')} \beta_A(t) \leq \beta_A(0) \leq \beta_A(x_0) = \inf_{t \in h^{-1}(a)} \beta_A(t) = \beta_{h(A)}(a)
\end{aligned}$$

$$\text{(iii)} \quad \min\{\mu_{h(A)}(a *' (b *' c)), \mu_{h(A)}(b)\} = \min\left\{ \sup_{t \in h^{-1}(a *' (b *' c))} \mu_A(t), \sup_{t \in h^{-1}(b)} \mu_A(t) \right\}$$

$$\begin{aligned}
&\leq \min\{\mu_A(x_0 * (y_0 * z_0)), \mu_A(y_0)\} \\
&\leq \mu_A(x_0 * z_0) \\
&= \sup_{t \in h^{-1}(a *' c)} \mu_A(t) = \mu_{h(A)}(a *' c) \\
\text{(iv)} \quad \max\{\beta_{h(A)}(a *' (b *' c)), \beta_{h(A)}(b)\} &= \max\left\{\inf_{t \in h^{-1}(a *' (b *' c))} \beta_A(t), \inf_{t \in h^{-1}(b)} \beta_A(t)\right\} \\
&\geq \max\{\beta_A(x_0 * (y_0 * z_0)), \beta_A(y_0)\} \\
&\geq \beta_A(x_0 * z_0) \\
&= \inf_{t \in h^{-1}(a *' c)} \beta_A(t) = \beta_{h(A)}(a *' c)
\end{aligned}$$

Hence  $h(A)$  is an intuitionistic fuzzy H-ideal of a Z-algebra Y.

**Theorem 3.9:** Let  $h : (X, *, 0) \rightarrow (Y, *, 0')$  be a Z-homomorphism of Z-algebras and B be an intuitionistic fuzzy H-ideal of a Z-algebra Y. Then the inverse image of B,  $h^{-1}(B) = \left\{x, \mu_{h^{-1}(B)}(x), \beta_{h^{-1}(B)}(x) \mid x \in X\right\}$  is an intuitionistic fuzzy H-ideal of a Z-algebra X.

**Proof:** Let  $x, y, z \in X$ . Now it is clear that

$$\begin{aligned}
\mu_{h^{-1}(B)}(0) &= \mu_B(h(0)) = \mu_B(0') \geq \mu_B(h(x)) = \mu_{h^{-1}(B)}(x) \\
\beta_{h^{-1}(B)}(0) &= \beta_B(h(0)) = \beta_B(0') \leq \beta_B(h(x)) = \beta_{h^{-1}(B)}(x) \\
\mu_{h^{-1}(B)}(x * z) &= \mu_B(h(x * z)) = \mu_B(h(x) *' h(z)) \geq \min\{\mu_B(h(x) *' (h(y) *' h(z))), \mu_B(h(y))\} \\
&= \min\{\mu_B(h(x * (y * z))), \mu_B(h(y))\} \\
&= \min\{\mu_{h^{-1}(B)}(x * (y * z)), \mu_{h^{-1}(B)}(y)\} \\
\beta_{h^{-1}(B)}(x * z) &= \beta_B(h(x * z)) = \beta_B(h(x) *' h(z)) \leq \max\{\beta_B(h(x) *' (h(y) *' h(z))), \beta_B(h(y))\} \\
&= \max\{\beta_B(h(x * (y * z))), \beta_B(h(y))\} \\
&= \max\{\beta_{h^{-1}(B)}(x * (y * z)), \beta_{h^{-1}(B)}(y)\}
\end{aligned}$$

Hence  $h^{-1}(B)$  is an intuitionistic fuzzy H-ideal of a Z-algebra X.

Analogously, we can prove the following result.

**Theorem 3.10:** Let  $h : (X, *, 0) \rightarrow (Y, *, 0')$  be an Z-epimorphism of Z-algebras. Let B be an intuitionistic fuzzy set of a Z-algebra Y. If  $h^{-1}(B)$  is an intuitionistic fuzzy H-ideal of a Z-algebra X then B is an intuitionistic fuzzy H-ideal of a Z-algebra Y.

**Theorem 3.11:** Let h be an Z-endomorphism of Z-algebra  $(X, *, 0)$ . If A be an intuitionistic fuzzy H-ideal of X. Then the intuitionistic fuzzy set  $A^h = (\mu_{A^h}, \beta_{A^h})$  is also an intuitionistic fuzzy H-ideal of X.

**Proof:** Follows directly from the definition.

**Theorem 3.12:** Let A and B be two intuitionistic fuzzy H-ideals in a Z-algebra X. Then  $A \times B$  is an intuitionistic fuzzy H-ideal of  $X \times X$ .

**Proof:** Take  $(x_1, x_2) \in X \times X$ .

$$\text{Then } \mu_{A \times B}(0,0) = \min\{\mu_A(0), \mu_B(0)\} \geq \min\{\mu_A(x_1), \mu_B(x_2)\} = \mu_{A \times B}(x_1, x_2)$$

$$\text{and } \beta_{A \times B}(0,0) = \max\{\beta_A(0), \beta_B(0)\} \leq \max\{\beta_A(x_1), \beta_B(x_2)\} = \beta_{A \times B}(x_1, x_2)$$

Now take  $(x_1, x_2), (y_1, y_2), (z_1, z_2) \in X \times X$ . Then

$$\mu_{A \times B}(x_1 * z_1, x_2 * z_2) = \min\{\mu_A(x_1 * z_1), \mu_B(x_2 * z_2)\}$$

$$\geq \min\{\min\{\mu_A(x_1 * (y_1 * z_1)), \mu_A(y_1)\}, \min\{\mu_B(x_2 * (y_2 * z_2)), \mu_B(y_2)\}\}$$

$$\begin{aligned} &= \min\{\min\{\mu_A(x_1 * (y_1 * z_1)), \mu_B(x_2 * (y_2 * z_2))\}, \min\{\mu_A(y_1), \mu_B(y_2)\}\} \\ &= \min\{\mu_{A \times B}((x_1, x_2) * ((y_1, y_2) * (z_1, z_2))), \mu_{A \times B}(y_1, y_2)\} \end{aligned}$$

$$\beta_{A \times B}(x_1 * z_1, x_2 * z_2) = \max\{\beta_A(x_1 * z_1), \beta_B(x_2 * z_2)\}$$

$$\leq \max\{\max\{\beta_A(x_1 * (y_1 * z_1)), \beta_A(y_1)\}, \max\{\beta_B(x_2 * (y_2 * z_2)), \beta_B(y_2)\}\}$$

$$\begin{aligned} &= \max\{\max\{\beta_A(x_1 * (y_1 * z_1)), \beta_B(x_2 * (y_2 * z_2))\}, \max\{\beta_A(y_1), \beta_B(y_2)\}\} \\ &= \max\{\beta_{A \times B}((x_1, x_2) * ((y_1, y_2) * (z_1, z_2))), \beta_{A \times B}(y_1, y_2)\} \end{aligned}$$

Hence  $A \times B$  is an intuitionistic fuzzy H-ideal of  $X \times X$ .

Analogously, we can prove the following results.

**Theorem 3.13:** Let A and B be two intuitionistic fuzzy sets of a Z-algebra X. If  $A \times B$  is an intuitionistic fuzzy H-ideal of  $X \times X$ , the following are true.

1.  $\mu_A(0) \geq \mu_B(y)$  and  $\mu_B(0) \geq \mu_A(x)$  for all  $x, y \in X$ .
2.  $\beta_A(0) \leq \beta_B(y)$  and  $\beta_B(0) \leq \beta_A(x)$  for all  $x, y \in X$ .

**Theorem 3.14:** Let A and B be two intuitionistic fuzzy sets of a Z-algebra X such that  $A \times B$  is an intuitionistic fuzzy H-ideal of  $X \times X$ . Then either A or B is an intuitionistic fuzzy H-Ideal of X.

#### 4. CONCLUSION:

In this paper, intuitionistic fuzzy H-ideals in Z-algebras is introduced and investigated some of their useful properties. In our future study of fuzzy structure of Z-algebras, may be the following topics should be considered: (i) to find translation of intuitionistic fuzzy H-ideals in Z-algebras, (ii) to find multiplication of intuitionistic fuzzy H-ideals in Z-algebras.

**ABSTRACT :** *In this paper, the role of ideals of STBE-algebras is discussed. Using the ideals, we construct an STBE-algebra and analyze the completion of the topologies that we have constructed. Results analogues to that of topological rings are also derived.*

**Keywords:** *STBE-Algebra, Ideals in STBE-Algebras, Directed sets, Quotient topology, Inverse system.*

## 1. INTRODUCTION:

To compare set theory with the logical systems, Y.Imai and K.Iseki introduced a new classes of algebras, called BCK-algebras and BCH-algebras. Many authors investigated these algebras. In [2], H.A.Kim and Y.H. Kim introduced the notion of BE-algebras, which is the generalization of BCK-algebras. In [7], Jansi M and Thiruvani V introduced the notion of ideals in TSBF-algebras. In [5], Thiruvani V, Lakshmi kumara P and Latha K.B studied separation axioms on S-Topological BE-algebras. In this paper, we discuss the role of ideals of STBE-algebras (S-Topological BE-algebras) and we construct STBE-algebras using ideals.

## 2. PRELIMINARIES:

**Definition 2.1** [2] A BE-algebra is an algebra  $(X, *, 1)$  of type  $(2,0)$  ( that is, a non-empty set  $X$  with a binary operation  $*$  and a constant  $1$ ) satisfying the following conditions

1.  $x * x = 1$
2.  $x * 1 = 1$
3.  $1 * x = x$
4.  $x * (y * z) = y * (x * z), \forall x, y, z \in X.$

**Definition 2.2** [2] A BE-algebra  $(X, *, 1)$  is called a commutative BE-algebra if it satisfies the identity  $(x * y) * y = (y * x) * x, \forall x, y \in X.$

**Theorem 2.3** [2] If  $X$  is a commutative BE-algebra then  $x * y = 1$  or  $y * x = 1$ , for all distinct  $x, y \in X.$

**Definition 2.4** [3] A subset  $A$  of a topological space is said to be semi-open if  $A \subseteq \overline{Int A}.$

**Definition 2.5** [3] The complement of a semi-open set is called semi-closed.

**Definition 2.6** [3] The semi-closure of a subset  $A$  of a topological space is the intersection of all semi-closed set containing  $A.$  It is denoted by  $\bar{A}^S.$

**Definition 2.7** [3] A subset  $A$  of a topological space is said to be regular open if  $A = \overline{Int A}.$

**Definition 2.8** [5] A BE-algebra  $(X, *, 1)$  equipped with a topology  $\tau_S$  is called S-topological BE-algebra (STBE-algebra) if the function  $f: X \times X \rightarrow X$  defined by,  $f(x, y) = x * y$  has the property that for each open set  $O$  containing  $x * y$ , there exists an open set  $U$  containing  $x$  and a semi-open set  $V$  containing  $y$  such that,  $U * V \subseteq O$ , for all  $x, y \in X$ .

**Definition 2.9** [6] Let  $(X, *, \tau_S)$  be a STBE-algebra. A non-empty subset  $A \subseteq X$  is called an ideal of  $X$  if

- 1)  $1 \in A$ ,
- 2)  $\forall y \in X$  and  $\forall x \in A$ , if  $x * y \in A$ , then  $y \in A$ .

**Definition 2.10** [8] Let  $S$  be a partially ordered set.  $S$  is called a directed set if for  $i, j \in S, \exists k \in S$ , such that  $i \leq k$  and  $j \leq k$ .

**Definition 2.11** [8] Let  $I \neq \emptyset$  be a subset of a BE-algebra  $X$ . Define a binary relation  $\equiv (mod I)$  as follows:

$x \equiv y (mod I)$  if  $x * y \in I$  and  $y * x \in I$ . The set  $\{b \in X / b \equiv a (mod I)\}$  is denoted by  $[a]_I$ .

### 3. ROLE OF IDEALS IN BE-ALGEBRAS:

**Definition 2.1** Let  $(X, *, 1)$  be a BE-algebra and  $S$  be a directed set. Define the family of ideals of  $X$  as  $\mathcal{F} = \{I_k / k \in S\}$  such that  $I_k \supseteq I_j$ , if  $i < j$ . ----- (1)

**Remark 2.2:** For  $a \in X, k \in S$ , define  $U(a, k) = \{x \in X / x \equiv a (mod I_k)\}$ .

Then  $\tau_k = \{U(a, k) / k \in S\} \cup \emptyset$  is a topology on  $X$ . Also  $\{I_k / k \in S\}$  is a topology on  $X$ .

**Remark 2.3:** 1. Fix  $a \in X$  and  $k \in S$ .

Then we have  $U(a, k) = X - \cup \{U(a, k) / x \not\equiv a (mod I_k)\}$ . So,  $U(a, k)$  is both open and closed.

**Theorem 2.4** Let  $(X, *, 1)$  be a STBE-algebra. Suppose that  $\{1\}$  is closed (open). Then  $\{a\}$  is closed (open) for all  $a \in X$ .

**Proof:** Let  $(X, *, 1)$  be a STBE-algebra. Then  $f: X \times X \rightarrow X$  be the continuous map defined by  $f(a, b) = a * b$ .

Now, we define a map  $g: X \times X \times X \rightarrow X \times X$  by  $g(a, b, c) = (a * b, b * c)$ .

As  $f$  is continuous,  $g$  is continuous.

Suppose that  $\{1\}$  is closed. Then  $\{1, 1\}$  is closed in  $X \times X$ .

Fix  $a \in X$ . Define a map  $h: X \rightarrow X \times X$  by  $h(b) = g(a, b, a) = (a * b, b * a)$ . Then  $h$  is the restriction of  $g$  to  $\{a\} \times X \times \{a\}$ . So,  $h$  is continuous.

Now,  $h^{-1}(\{1, 1\}) = \{b / a * b = 1 \text{ and } b * a = 1\} = \{a\} \Rightarrow \{a\}$  is closed (open) as  $\{1\}$  is closed (open).

Now, we construct the inverse system.

The quotient topology  $X / I_k$  on each  $I_k$  is discrete. If  $i < j$ , there is a natural homomorphism

$\varphi_{ij}: X / I_i \rightarrow X / I_j$ . So, we can construct the inverse system  $\{X / I_i, \varphi_{ij}\}$ . The inverse limit is

$\lim_{\leftarrow} X / I_i = \hat{X}$ . Then  $\hat{X}$  is the completion of  $X$ . The following lemma is obvious.

**Lemma 2.5**  $\psi: X \rightarrow \hat{X}$  is continuous and  $\psi(X)$  is dense in  $\hat{X}$ .

**Remark 2.6** Let  $\pi_i: \hat{X} \rightarrow X / I_i$ . Then  $\pi_i$  is a natural projection. Let  $X^* = \ker \pi_i$

Then  $\{X_i^* / i \in S\}$  is a family of ideals of  $X^*$  such that if  $i < j$ , then  $X_j^* \subseteq X_i^*$

Now, for each  $i \in S$  and each  $\{[a_k] / k \in S\} \in \hat{X}$ .

Let  $\cup (\{[a_k]\}_{k \in S}, i) = \{[b_k]\}_{k \in S} \in \hat{X} / \{[b_k]\}_{k \in S} \equiv \{[a_k]\}_{k \in S} \text{ mod } X_i^*$ .

Then  $\cup (\{[a_k]\}_{k \in S}, i) = \prod \{U_k / k \in S\}$ , where  $U_k = \pi_k(\widehat{X})$  if  $k \neq i$  and  $U_k$  is the singleton  $[a_i]$ . Hence  $\cup (\{[a_k]\}_{k \in S}, i)$  is open. So, we get a topology induced by the family of ideals  $\{X_i^* / i \in S\}$ .

Also we see that  $\pi_i(\psi(X)) = X / I_i \Rightarrow \pi_i$  is onto.

Hence  $X / I_i \cong \hat{X} / \ker \pi_i = \hat{X} / X_i^*$ . So, the completion of  $\hat{X}$  is  $\hat{X}$ .

Consider two directed sets  $S_1$  and  $S_2$ . Then the sets of ideals  $\mathcal{F}_1 = \{I_i / i \in S_1\}$  and  $\mathcal{F}_2 = \{J_i / i \in S_2\}$  both induce the same topology on  $X$  if and only if for each  $U(a, i)$  ( $i \in S_1$ ), there exists  $k \in S_2$  such that  $U(a, k) \subset U(a, i)$  and for each  $U(a, k)$  ( $k \in S_2$ ) there exist  $i \in S_1$  such that  $U(a, i) \subset U(a, k)$ . If this is the case, then  $\varprojlim X / I_i \rightarrow \varprojlim X / J_i$  is an isomorphism.

Now, the following lemma is obvious.

**Lemma 2.7**  $\psi : X \rightarrow \hat{X}$  is injective if and only if  $\cap \{I_i / i \in S\} = \{0\}$ . That is if and only if  $X$  is  $T_1$ .

**Theorem 2.8** If  $A \subset X$ , then  $\tilde{A} = \cap_{i \in S} \cup_{x \in A} U(x, i)$ , where  $\tilde{A}$  is the topological closure of  $A$ .

**Proof:** Let  $A \subset X$ . We have  $X - \cup \{U(x, i) / x \in A\} = \cup \{U(y, i) / \text{for all } x \in A, y \neq x\}$   
 Since  $\cup \{U(y, i) / \text{for all } x \in A, y \neq x\}$  is open, we have  $X - \cup \{U(x, i) / x \in A\}$  is open.  
 $\Rightarrow \cup \{U(x, i) / x \in A\}$  is closed and it contains  $A$ .  $\Rightarrow \tilde{A} = \cap_{i \in S} \cup_{x \in A} U(x, i)$ ,

**Theorem 2.9** If  $I$  is an open (closed) ideal, then for each  $x \in X$ ,  $\{y \in X / y \equiv x \text{ mod } I\}$  is open (closed).

**Proof:** Let  $x \in X$ . Define a left map  $L_x : X \rightarrow X$ , by  $L_x(y) = x * y$  and a right map  $R_x : X \rightarrow X$ , by  $R_x(y) = y * x$ . Then  $L_x$  and  $R_x$  are continuous.

Assume that  $I$  is an open ideal.  $\Rightarrow L_x^{-1}(I)$  and  $R_x^{-1}(I)$  are open  $\Rightarrow L_x^{-1}(I) \cap R_x^{-1}(I)$  is open.

But  $L_x^{-1}(I) \cap R_x^{-1}(I) = \{y \in X / x * y, y * x \in I\} = \{y \in X / y \equiv x \text{ mod } I\}$ .

Hence,  $\{y \in X / y \equiv x \text{ mod } I\}$  is open.

Similarly, we can prove that if  $I$  is closed, then  $\{y \in X / y \equiv x \text{ mod } I\}$  is closed.

**Theorem 2.10** Every open ideal in  $X$  is closed.

**Proof:** Let  $I$  be an open ideal of  $X$ . From theorem 2.9, for each  $x \in X$ ,  $\{y \in X / y \equiv x \text{ mod } I\}$  is open. But  $I$  is the complement of the union of all other congruence classes.

That is  $I = \{ \cup \{y \in X / y \equiv x \text{ mod } I\} \}^c$ .

Since,  $\cup \{y \in X / y \equiv x \text{ mod } I\}$  is open, its complement  $I$  is closed.

**ABSTRACT :** *A more natural and necessary generalization of the intuitionistic fuzzy theory is developed and introduce the concept of  $k$ -intuitionistic fuzzy ideals. In this paper we prove many theorems in the concept of ideals.*

## **1. INTRODUCTION:**

In the current century fuzzy theory has its vast applications in almost all fields, which are related to Mathematics technically. Based on the concept of fuzzy theory, intuitionistic fuzzy theory was develop, but the theory in some way didn't emerged as much as fuzzy theory. In most natural situations like buying a new car, judging about a persons various personalities, both fuzzy theory and intuitionistic fuzzy theory were insufficient. So, we are in need to develop a new structure to annihilate the insufficiency.

Fuzzy subsets were developed by Zadeh [7] as functions from a set  $X$  to the closed interval  $[0,1] \subseteq \mathbb{R}$  to study the uncertainties; it study the gradual membership of an object in a set. In the name Zadeh, fuzzy theory has emerged as an important notion in the field of Mathematics. Many of its branches, like fuzzy group theory, fuzzy topology, fuzzy metricspaces were developed and studied by many others. Joseph G. Brown, A. Rosenfeld, W.M. Wu, Rajeshkumar, [4] are some, who studied fuzzy theory in the context of Algebra. K. T. Atanassov [1] developed the concept intuitionistic fuzzy subsets in 1983.

### **Basic definitions:**

#### **Definition: 1.1**

Let  $S$  be any nonempty set. A mapping  $\mu: S \rightarrow [0,1]$  is called a fuzzy subset of  $S$ .

#### **Definition: 1.2**

Let  $\mu$  be any fuzzy subset of a set  $S$  and let  $t \in [0,1]$ . The set  $\mu_t = \{x \in S / \mu(x) \geq t\}$  is called a level subset of  $\mu$ .

#### **Definition: 1.3**

Let  $f$  be any function from a set  $S$  to a set  $T$ . Let  $\mu$  be any fuzzy subset of  $S$  and let  $\sigma$  be any fuzzy subset of  $T$ . Then the image of  $\mu$  under  $f$  denoted by  $f(\mu)$ , is a fuzzy subset of  $T$  denoted by:

$$(f(\mu))(y) = \begin{cases} \sup_{x \in f^{-1}(y)} \mu(x) & \text{if } f^{-1}(y) \neq \emptyset \\ 0 & \text{otherwise} \end{cases}$$

where  $y \in T$ .

The inverse image of  $\sigma$  under  $f$ , symbolized as  $f^{-1}(\sigma)$ , is a fuzzy subset of  $S$ , defined by  $f^{-1}(\sigma)(x) = \sigma(f(x))$  for all  $x \in S$ .

**Definition :1.4**

A fuzzy subset  $\mu$  of a ring  $\mathbb{R}$  is called a fuzzy subring of  $\mathbb{R}$ , if

- (i)  $\mu(x - y) \geq \mu(x) \wedge \mu(y)$
- (ii)  $\mu(xy) \geq \mu(x) \wedge \mu(y)$  for all  $x, y \in \mathbb{R}$

**Definition : 1.5**

A fuzzy subset  $\mu$  of a ring  $\mathbb{R}$  is called a fuzzy ideal of  $\mathbb{R}$ , if

- (i)  $\mu(x - y) \geq \mu(x) \wedge \mu(y)$
- (ii)  $\mu(xy) \geq \mu(x) \vee \mu(y)$  for all  $x, y \in \mathbb{R}$

**Definition: 1.6**

Let  $X$  be a fixed non-empty set. An intuitionistic fuzzy set  $A$  in  $X$  is an object having the form  $A^* = \{\langle x, \mu_A(x), \vartheta_A(x) \rangle / x \in X\}$ , where  $\mu_A: X \rightarrow [0,1]$  and  $\vartheta_A: X \rightarrow [0,1]$  define the degree of membership and degree of non-membership of the element  $x \in X$  to the set  $A$ , which is a subset of  $X$ , respectively, and for every  $x \in X$ , we have  $0 \leq \mu_A(x) + \vartheta_A(x) \leq 1$

**Definition: 1.7**

For any two intuitionistic fuzzy subsets  $A$  and  $B$  of a set  $X$ , the following properties hold:

- $A \subset B$  if  $\mu_A(x) \leq \mu_B(x)$  and  $\vartheta_A(x) \geq \vartheta_B(x)$ , for all  $x \in X$ .
- $A = B$  if  $A \subset B$  and  $B \subset A$
- $\bar{A} = \{\langle x, \mu_A(x), \vartheta_A(x) \rangle\}, x \in X$
- $A \cap B = \{\langle x, \min\{\mu_A(x), \mu_B(x)\}, \max\{\vartheta_A(x), \vartheta_B(x)\} \rangle\}, x \in X$
- $A \cup B = \{\langle x, \max\{\mu_A(x), \mu_B(x)\}, \min\{\vartheta_A(x), \vartheta_B(x)\} \rangle\}, x \in X$

**Note:** In what follows in this paper, we define an intuitionistic fuzzy set  $A$  of set  $X$  as a pair  $(\mu_A, \vartheta_A)$ , for simplicity.

**2 k-INTUITIONISTIC FUZZY STRUCTURES:**

In our trending world, fuzzy theory has its wide applications in almost all fields, for example, signal processing, telecommunication, aerospace, automotive, robotics, chemical industry, electronics, medical, mining and metal processing. Even though fuzzy logic has emerged as unavoidable branch of mathematics, the theory is insufficient in some sense in many real life situations. For example, while buying a plot in a city, as a buyer one man will have his own desire and expectation about his plot. That is, he may expect, the plot should be around 3000sqft, the ground water level should be high; bus stand, schools, hospitals and colleges should be at minimum distance; there should be a good road facility, etc., It is not quite possible practically, to fulfill all his expectations. So, if a buyer say I will buy a plot, only if all my expectations are fulfilled means; he will never buy a plot in his lifetime. So, he should relax his own level of expectations; matter of acceptance and opposition level of his expectations, plays a vital role here. Thus we need a structure, to discuss about the level of acceptance and the level of opposition, of a finite set of properties of an object.

**Definition : 2.1**

Let  $X$  be a non-empty set. Let  $k$  be a positive integer. Then a  $k$ -intuitionistic fuzzy subset of a set  $X$  is an ordered  $2k$  tuple  $(\mu_1, \mu_2, \dots, \mu_k, \vartheta_1, \vartheta_2, \dots, \vartheta_k)$  of functions from  $X$  to  $[0,1]$  satisfying  $\mu_i(x) + \vartheta_i(x) \leq 1$  for all  $i = 1, 2, \dots, k$  and for all  $x \in X$ .

We denote a  $k$ - intuitionistic fuzzy subset  $A$  as an ordered  $2k$  tuple

$(\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$  throughout the paper.

**Definition: 2.2**

For any two  $k$ -intuitionistic fuzzy subsets  $A$  and  $B$  of a set  $X$ , we define

- $A \subseteq B$  if  $\mu_{A_i}(x) \leq \mu_{B_i}(x)$  and  $\vartheta_{A_i}(x) \geq \vartheta_{B_i}(x)$ , for all  $x \in X$  and for all  $i = 1, 2, \dots, k$
- $A = B$  if  $A \subseteq B$  and  $B \subseteq A$
- $\bar{A}(x) = (\vartheta_{A_1}(x), \vartheta_{A_2}(x), \dots, \vartheta_{A_k}(x), \mu_{A_1}(x), \mu_{A_2}(x), \dots, \mu_{A_k}(x)), x \in X$
- $(A \cap B)(x) = ((\mu_{A_1}(x) \wedge \mu_{B_1}(x)), \dots, (\mu_{A_k}(x) \wedge \mu_{B_k}(x)), (\vartheta_{A_1}(x) \vee \vartheta_{B_1}(x)), \dots, (\vartheta_{A_k}(x) \vee \vartheta_{B_k}(x))), x \in X$
- $(A \cup B)(x) = ((\mu_{A_1}(x) \vee \mu_{B_1}(x)), \dots, (\mu_{A_k}(x) \vee \mu_{B_k}(x)), (\vartheta_{A_1}(x) \wedge \vartheta_{B_1}(x)), \dots, (\vartheta_{A_k}(x) \wedge \vartheta_{B_k}(x))), x \in X$

**Definition: 2.3**

Let  $f$  be a function from  $X$  to  $Y$  and let  $A = (\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$  be a  $k$  – intuitionistic fuzzy subset in  $X$ . The image of  $A$ , written as  $f(A)$  is a  $k$  – intuitionistic in  $Y$  is given by,

$$f(A) = (\mu_{f(A)_1}, \mu_{f(A)_2}, \dots, \mu_{f(A)_k}, \vartheta_{f(A)_1}, \vartheta_{f(A)_2}, \dots, \vartheta_{f(A)_k})$$

where,

$$\mu_{f(A)_i}(y) = \begin{cases} \sup_{x \in f^{-1}(y)} \{\mu_{A_i}(x)\} & \text{if } f^{-1}(y) \neq \emptyset \\ 0 & \text{otherwise} \end{cases}$$

and

$$\vartheta_{f(A)_i}(y) = \begin{cases} \inf_{x \in f^{-1}(y)} \{\vartheta_{A_i}(x)\} & \text{if } f^{-1}(y) \neq \emptyset \\ 1 & \text{otherwise} \end{cases}$$

**Definition: 2.4**

Let  $f$  be a function from  $X$  to  $Y$  and let  $A = (\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$  be a  $k$  – intuitionistic fuzzy subset in  $Y$ . Then the inverse of  $A$  is written as  $f^{-1}(A)$  is a  $k$  – intuitionistic fuzzy subset in  $X$  given by,

$$f^{-1}(A) = (\mu_{f^{-1}(A)_1}, \mu_{f^{-1}(A)_2}, \dots, \mu_{f^{-1}(A)_k}, \vartheta_{f^{-1}(A)_1}, \vartheta_{f^{-1}(A)_2}, \dots, \vartheta_{f^{-1}(A)_k})$$

where  $\mu_{f^{-1}(A)_i}(x) = \mu_{A_i}(f(x))$  and  $\vartheta_{f^{-1}(A)_i}(x) = \vartheta_{A_i}(f(x))$ , for all  $i = 1, 2, \dots, k$  and for all  $x \in X$ .

**3 k-INTUIOTIONISTIC FUZZY IDEALS :**

**Definition: 3.1**

Let  $\mathbb{R}$  be a ring. A  $k$  – intuitionistic fuzzy subset  $A$  of  $\mathbb{R}$  is said to be a  $k$  – intuitionistic fuzzy subring of  $\mathbb{R}$  if it satisfies the following conditions:

- (i)  $\mu_{A_i}(x - y) \geq \mu_{A_i}(x) \wedge \mu_{A_i}(y)$
- (ii)  $\mu_{A_i}(xy) \geq \mu_{A_i}(x) \wedge \mu_{A_i}(y)$
- (iii)  $\vartheta_{A_i}(x - y) \leq \vartheta_{A_i}(x) \vee \vartheta_{A_i}(y)$
- (iv)  $\vartheta_{A_i}(xy) \leq \vartheta_{A_i}(x) \vee \vartheta_{A_i}(y)$  for all  $i = 1, 2, \dots, k$  and for all  $x \in X$

**Definition : 3.2**

Let  $\mathbb{R}$  be a ring. A  $k$  – intuitionistic fuzzy subset  $A$  of  $\mathbb{R}$  is said to be a  $k$  – intuitionistic fuzzy ideal of  $\mathbb{R}$  if it satisfies the following conditions;

- (i)  $\mu_{A_i}(x - y) \geq \mu_{A_i}(x) \wedge \mu_{A_i}(y)$
- (ii)  $\mu_{A_i}(xy) \geq \mu_{A_i}(x) \vee \mu_{A_i}(y)$
- (iii)  $\vartheta_{A_i}(x - y) \leq \vartheta_{A_i}(x) \vee \vartheta_{A_i}(y)$
- (iv)  $\vartheta_{A_i}(xy) \leq \vartheta_{A_i}(x) \wedge \vartheta_{A_i}(y)$  for all  $i = 1, 2, \dots, k$  and for all  $x \in X$

**Example: 3.3**

Let  $\mathbb{R}$  be a ring of real numbers under the usual operations of addition and multiplication. Then the  $k$  – intuitionistic fuzzy subset  $A$  of  $\mathbb{R}$  defined by

$$\mu_{A_i}(x) = \begin{cases} 0 & \text{if } x \text{ is rational} \\ 0.8 & \text{otherwise} \end{cases}$$

$$\vartheta_{A_i}(x) = \begin{cases} 1 & \text{if } x \text{ is rational} \\ 0.1 & \text{otherwise} \end{cases}$$

$A$  is a  $k$  – intuitionistic fuzzy ideal of  $\mathbb{R}$ .

**Theorem : 3.4**

Let  $\mathbb{R}$  be a ring. Let  $A$  and  $B$  be any two  $k$  – intuitionistic fuzzy ideal. Then  $A \cap B$  is also a  $k$  – intuitionistic fuzzy ideal.

**Proof:**

Let  $A = (\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$

And  $B = (\mu_{B_1}, \mu_{B_2}, \dots, \mu_{B_k}, \vartheta_{B_1}, \vartheta_{B_2}, \dots, \vartheta_{B_k})$  be two  $k$  – intuitionistic fuzzy ideal.

Then we have  $(A \cap B)(x) = ((\mu_{A_1}(x) \wedge \mu_{B_1}(x)), \dots, (\mu_{A_k}(x) \wedge \mu_{B_k}(x)),$   
 $(\vartheta_{A_1}(x) \vee \vartheta_{B_1}(x)), \dots, (\vartheta_{A_k}(x) \vee \vartheta_{B_k}(x)))$  for all  $x \in X$ .

We take  $(\mu_{A_i} \wedge \mu_{B_i}) = \gamma_i$  and  $(\vartheta_{A_i} \vee \vartheta_{B_i}) = \gamma_i'$  for all  $i = 1, 2, \dots, k$

Then,  $A \cap B = (\gamma_1, \gamma_2, \dots, \gamma_k, \gamma_1', \gamma_2', \dots, \gamma_k')$

Now,  $\gamma_i(x - y) = (\mu_{A_i}(x - y) \wedge \mu_{B_i}(x - y))$

$$\begin{aligned} &\geq (\mu_{A_i}(x) \wedge \mu_{A_i}(y)) \wedge (\mu_{B_i}(x) \wedge \mu_{B_i}(y)) \\ &= (\mu_{A_i}(x) \wedge \mu_{B_i}(x)) \wedge (\mu_{A_i}(y) \wedge \mu_{B_i}(y)) \\ &= [\gamma_i(x) \wedge \gamma_i(y)] \end{aligned}$$

Therefore,  $\gamma_i(x - y) \geq [\gamma_i(x) \wedge \gamma_i(y)]$

Now,  $\gamma_i(xy) = (\mu_{A_i}(xy) \wedge \mu_{B_i}(xy))$

$$\begin{aligned} &\geq (\mu_{A_i}(x) \vee \mu_{A_i}(y)) \wedge (\mu_{B_i}(x) \vee \mu_{B_i}(y)) \\ &= (\mu_{A_i}(x) \wedge \mu_{B_i}(x)) \vee (\mu_{A_i}(y) \wedge \mu_{B_i}(y)) \\ &= [\gamma_i(x) \vee \gamma_i(y)] \end{aligned}$$

Therefore,  $\gamma_i(xy) \geq [\gamma_i(x) \vee \gamma_i(y)]$

Similarly, we can prove (iii) and (iv) of the definition (13).

**Theorem : 3.5**

Let  $\mathbb{R}$  and  $\mathbb{R}'$  be two rings and  $f: \mathbb{R} \rightarrow \mathbb{R}'$  be an onto homomorphism. Let  $A$  be a  $k$  – intuitionistic fuzzy ideal of  $\mathbb{R}$ . Then  $f(A)$  is a  $k$  – intuitionistic fuzzy ideals of  $\mathbb{R}'$ .

**Proof:** Let  $A = (\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$  be a  $k$  – intuitionistic fuzzy ideal of  $\mathbb{R}$ .

**Claim:**  $f(A)$  is a  $k$  – intuitionistic fuzzy ideals of  $\mathbb{R}'$

Let  $x, y \in \mathbb{R}'$ , then we have

$$\mu_{f(A)_i}(x) = \begin{cases} \sup_{u \in f^{-1}(x)} \{\mu_{A_i}(u)\} & \text{if } f^{-1}(x) \neq \emptyset \\ 0 & \text{otherwise} \end{cases}$$

$$\vartheta_{f(A)_i}(x) = \begin{cases} \inf_{u \in f^{-1}(x)} \{\vartheta_{A_i}(u)\} & \text{if } f^{-1}(x) \neq \emptyset \\ 1 & \text{otherwise} \end{cases}$$

$$\mu_{f(A)_i}(y) = \begin{cases} \sup_{v \in f^{-1}(y)} \{\mu_{A_i}(v)\} & \text{if } f^{-1}(y) \neq \emptyset \\ 0 & \text{otherwise} \end{cases}$$

and

$$\vartheta_{f(A)_i}(y) = \begin{cases} \inf_{v \in f^{-1}(y)} \{\vartheta_{A_i}(v)\} & \text{if } f^{-1}(y) \neq \emptyset \\ 1 & \text{otherwise} \end{cases}$$

Now we prove that,

If  $u \in f^{-1}(x)$  and  $v \in f^{-1}(y)$ , then  $u - v \in f^{-1}(x - y)$  and  $uv \in f^{-1}(xy)$

For,

Let  $u \in f^{-1}(x)$  and  $v \in f^{-1}(y)$  then  $f(u) = x$  and  $f(v) = y$

$$\Rightarrow f(u) - f(v) = f(u - v) = x - y$$

$$\Rightarrow u - v \in f^{-1}(x - y)$$

Similarly,  $uv \in f^{-1}(xy)$ .

$$\mu_{f(A)_i}(x - y) = \begin{cases} \sup_{z \in f^{-1}(x - y)} \{\mu_{A_i}(z)\} & \text{if } f^{-1}(x - y) \neq \emptyset \\ 0 & \text{otherwise} \end{cases}$$

and

$$\vartheta_{f(A)_i}(x - y) = \begin{cases} \inf_{z \in f^{-1}(x - y)} \{\vartheta_{A_i}(z)\} & \text{if } f^{-1}(x - y) \neq \emptyset \\ 1 & \text{otherwise} \end{cases}$$

Consider  $\mu_{f(A)_i}(x - y) = \sup_{z \in f^{-1}(x - y)} \mu_{A_i}(z)$

$$= \sup_{u - v \in f^{-1}(x - y)} \mu_{A_i}(u - v)$$

$$\geq \sup_{u - v \in f^{-1}(x - y)} (\mu_{A_i}(u) \wedge \mu_{A_i}(v))$$

$$\geq \sup_{u \in f^{-1}(x)} (\mu_{A_i}(u)) \wedge \sup_{v \in f^{-1}(y)} (\mu_{A_i}(v))$$

$$\geq \mu_{f(A)_i}(x) \wedge \mu_{f(A)_i}(y)$$

Hence  $\mu_{f(A)_i}(x - y) \geq \mu_{f(A)_i}(x) \wedge \mu_{f(A)_i}(y)$  for all  $i$  and for all  $x, y \in \mathbb{R}'$ .

Similarly we can prove the conditions (ii), (iii) and (iv) of definition (13).

Hence  $f(A)$  is a  $k$  - intuitionistic fuzzy ideal of  $\mathbb{R}'$ .

**Theorem:3.6** Let  $\mathbb{R}$  and  $\mathbb{R}'$  be two rings and  $f: \mathbb{R} \rightarrow \mathbb{R}'$  be an onto homomorphism. Let  $A'$  be a  $k$  - intuitionistic fuzzy ideal of  $\mathbb{R}'$ . Then  $f^{-1}(A')$  is a  $k$  - intuitionistic fuzzy ideals of  $\mathbb{R}$ .

**Proof:**

Let  $A' = (\mu_{A_1}', \mu_{A_2}', \dots, \mu_{A_k}', \vartheta_{A_1}', \vartheta_{A_2}', \dots, \vartheta_{A_k}')$  be a  $k$  - intuitionistic fuzzy ideal of  $\mathbb{R}'$ .

Then  $f^{-1}(A') = (\mu_{f^{-1}(A)_1}', \mu_{f^{-1}(A)_2}', \dots, \mu_{f^{-1}(A)_k}', \vartheta_{f^{-1}(A)_1}', \vartheta_{f^{-1}(A)_2}', \dots, \vartheta_{f^{-1}(A)_k}'$  where

$$\mu_{f^{-1}(A)_i}'(x) = \mu_{A_i}'(f(x)) \text{ and } \vartheta_{f^{-1}(A)_i}'(x) = \vartheta_{A_i}'(f(x))$$

Let  $x, y \in \mathbb{R}$

$$\begin{aligned}
\text{Now, } \mu_{f^{-1}(A)_i}'(x - y) &= \mu_{A_i}'f(x - y) \\
&= \mu_{A_i}'(f(x) - f(y)) \\
&\geq \mu_{A_i}'(f(x)) \wedge \mu_{A_i}'(f(y)) \\
&= \mu_{f^{-1}(A)_i}'(x) \wedge \mu_{f^{-1}(A)_i}'(y)
\end{aligned}$$

$$\text{Hence } \mu_{f^{-1}(A)_i}'(x - y) \geq \mu_{f^{-1}(A)_i}'(x) \wedge \mu_{f^{-1}(A)_i}'(y)$$

$$\begin{aligned}
\text{Now, } \mu_{f^{-1}(A)_i}'(xy) &= \mu_{A_i}'f(xy) \\
&= \mu_{A_i}'(f(x).f(y)) \\
&\geq \mu_{A_i}'(f(x)) \vee \mu_{A_i}'(f(y)) \\
&= \mu_{f^{-1}(A)_i}'(x) \vee \mu_{f^{-1}(A)_i}'(y)
\end{aligned}$$

$$\text{Hence } \mu_{f^{-1}(A)_i}'(xy) \geq \mu_{f^{-1}(A)_i}'(x) \vee \mu_{f^{-1}(A)_i}'(y)$$

$$\begin{aligned}
\text{Similarly we can prove } \vartheta_{f^{-1}(A)_i}'(x - y) &\leq \vartheta_{f^{-1}(A)_i}'(x) \vee \vartheta_{f^{-1}(A)_i}'(y) \\
\vartheta_{f^{-1}(A)_i}'(xy) &\leq \vartheta_{f^{-1}(A)_i}'(x) \wedge \vartheta_{f^{-1}(A)_i}'(y)
\end{aligned}$$

Hence  $f^{-1}(A')$  is a  $k$  – intuitionistic fuzzy ideals of  $\mathbb{R}$ .

**Theorem : 3.7**

Let  $\mathbb{R}$  be any ring and  $A$  be a fuzzy ideal of a ring  $\mathbb{R}$  and if  $\mu_{A_i}(x) < \mu_{A_i}(y)$  for some  $x, y \in \mathbb{R}$ . Then  $\mu_{A_i}(x - y) = \mu_{A_i}(x) = \mu_{A_i}(y - x)$  for all  $i = 1, 2, \dots, k$

**Proof:**

Let  $A = (\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$  be a  $k$  – intuitionistic fuzzy ideal of  $\mathbb{R}$ .

Let  $\mu_{A_i}(x) < \mu_{A_i}(y)$  for some  $x, y \in \mathbb{R}$

**Claim:**  $\mu_{A_i}(x - y) = \mu_{A_i}(x) = \mu_{A_i}(y - x)$  for all  $i = 1, 2, \dots, k$

$$\begin{aligned}
\text{Now } \mu_{A_i}(x - y) &\geq \mu_{A_i}(x) \wedge \mu_{A_i}(y) \\
&= \mu_{A_i}(x) \dots \dots \dots (1)
\end{aligned}$$

$$\begin{aligned}
\text{And consider } \mu_{A_i}(x) &= \mu_{A_i}(xyy^{-1}) \\
&= \mu_{A_i}((xy)y^{-1}) \\
&\geq [\mu_{A_i}(xy) \wedge \mu_{A_i}(y^{-1})] \\
&\geq [\mu_{A_i}(x) \wedge \mu_{A_i}(y)] \wedge \mu_{A_i}(y^{-1}) \\
&\geq \mu_{A_i}(x) \wedge \mu_{A_i}(y) \\
&= \mu_{A_i}(x - y) \dots \dots \dots (2)
\end{aligned}$$

$$\text{From (1) and (2) implies, we get, } \mu_{A_i}(x - y) = \mu_{A_i}(x) \dots \dots \dots (3)$$

$$\text{Similarly, we can prove, } \mu_{A_i}(x) = \mu_{A_i}(y - x) \dots \dots \dots (4)$$

$$\text{From (3) and (4) implies, we get, } \mu_{A_i}(x - y) = \mu_{A_i}(x) = \mu_{A_i}(y - x)$$

**Definition: 3.8**

Let  $\mathbb{R}$  be a ring and  $A$  be a  $k$  –intuitionistic fuzzy ideal of  $\mathbb{R}$ . Let  $t \in [0,1]$  and  $t \leq \mu_{A_i}(e) + \vartheta_{A_i}(e)$ . The  $k$  –intuitionistic fuzzy ideal  $A_t$  is called  $k$  –intuitionistic level ideal of  $A$ .

**Theorem: 3.9**

Let  $\mathbb{R}$  be a ring. Let  $A_t$  and  $A_s$  are two  $k$  –intuitionistic level ideals of  $\mathbb{R}$  are equal if and only if there is no  $x$  in  $\mathbb{R}$  such that  $s \leq \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$ .

**Proof:**

Let  $A = (\mu_{A_1}, \mu_{A_2}, \dots, \mu_{A_k}, \vartheta_{A_1}, \vartheta_{A_2}, \dots, \vartheta_{A_k})$  be a  $k$  – intuitionistic fuzzy ideal of  $\mathbb{R}$ .

Let  $A_t$  and  $A_s$  are two  $k$  –intuitionistic level ideals of  $\mathbb{R}$ .

Suppose  $A_t = A_s$  ( $s < t$ )

**Claim:** There is no  $x$  in  $\mathbb{R}$  such that  $s \leq \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$

Assume that  $x$  in  $\mathbb{R}$  such that  $s \leq \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$

$$\Rightarrow \mu_{A_i}(x) + \vartheta_{A_i}(x) \geq s \text{ and } \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$$

$$\Rightarrow x \in A_s \text{ and } x \notin A_t$$

$$\Rightarrow A_s \neq A_t$$

Which is the contradiction to our assumption

Therefore there is no  $x$  in  $\mathbb{R}$  such that  $s \leq \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$

**Conversely,**

Suppose that there is no  $x$  in  $\mathbb{R}$  such that  $s \leq \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$

**Claim:**  $A_t = A_s$

Suppose that  $A_s \neq A_t$

If  $s < t$  then  $A_t \subset A_s$

For,

Let  $x \in A_t$

$$\Rightarrow \mu_{A_i}(x) + \vartheta_{A_i}(x) \geq t > s$$

$$\Rightarrow \mu_{A_i}(x) + \vartheta_{A_i}(x) > s$$

Then  $\Rightarrow x \in A_s$

$$\Rightarrow A_t \subset A_s$$

It is enough to prove that  $A_t \not\subset A_s$

$$\Rightarrow x \in A_s \text{ and } x \notin A_t$$

$$\Rightarrow \mu_{A_i}(x) + \vartheta_{A_i}(x) \geq s \text{ and } \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$$

Thus there exists an element in  $\mathbb{R}$  such that  $s \leq \mu_{A_i}(x) + \vartheta_{A_i}(x) < t$

Which is the contradiction to our assumption

Therefore,  $A_t = A_s$ .

**4. CONCLUSION :**

Necessity is the mother of invention. In this fast moving world, the necessity of the fuzzy theory became unavoidable. Every man in his day-to-day life, wants to find some thing new and different from others; the new structure developed here is one of such kind. In a short span of time, we made a study on the fuzzy theory and intuitionistic fuzzy theory. We define a new structure called a  $k$  –intuitionistic fuzzy subset and developed the respective theory mainly in the context of algebra. This can be further developed wherever fuzzy theory can be discussed.

**ABSTRACT:** *Prediction of rainfall is the implementation of using science and technology to predict the state of the atmosphere. It is critical to calculating rainfall to effectively use water resources, agriculture production, and water structure development. The Regression technique makes several valuable contributions to the forecasting problem's solution. It also calculates the dependent variable's value estimates based on the independent variable's values. This article develops a multiple linear regression model for annual rainfall in Coimbatore District. The study represents the referred mathematical process and the prediction by using weather variables as input information. The model has developed using data from 2001 to 2020, and testing forecasts the rainfall intensity over the following years.*

**Keywords:** *Annual Rainfall, Multi Linear Regression, Weather variables.*

## 1. INTRODUCTION

Rainfall significantly affects the activities of human life. The diversity is quite large and characterizes the climate in the Coimbatore district in Tamil Nadu. Global climate change can increase the incidence of extreme rainfall. The analysis is needed to obtain rainfall prediction information that is very useful for reducing the impact of possible extreme rain events. Prediction of rainfall is still a considerable challenge to climatologists. However, it is the essential component of a climate system. Most of the burning issues of our time, like a global warning, floods, drought, heatwaves, soil erosion, and many other climatic problems, are directly related to rainfall. Agriculture is still the primary source of economic activities in most countries of the world, and rainfall increases crop production and protects the crops, human life, and the ecosystem. There is an increasing demand from policymakers for a reliable prediction of precipitation. Therefore it is vital to be able to predict rainfall correctly.

Time series data forecasting is a part of statistical modeling widely used in various fields because of its benefits in decision making. Time series analysis has several objectives, namely forecasting modeling and control. Forecasting is an element that is important in decision-making activities because whether or not an effective decision is made depends on several factors that influence it. However, unseen when a decision is taken. The purpose of time series forecasting is to predict the future values of certain variables that vary with time using their previous values. Forecasting is related to the formation of models and methods that can be used

to produce a good forecast. The use of time-series data for forecasting is based on the behavior of past events.

In time-series data, the behavior of past events can be used for forecasting because it is expected that, in the future, the influence of the behavior of past events will still occur. The benefits of forecasting can be felt in many fields, including economics, finance, marketing, and production. Generally, time-series research uses linear time series models. Specifically, linear regression is a predictive statistical approach for modeling the relationship between a dependent variable with a given set of independent variables. Regression models are often used for estimating future events or values. Regression analysis includes parametric methods such as linear and logistic regression. Non-parametric methodologies such as projection pursuit, additive models, multivariate adaptive regression, etc., have also been applied to estimation and prediction problems (Holmstrom et al. 1997).

Regression analysis yields estimations of the dependent variable's values based on the independent variable's values. First, measure the strength of the regression relationship between y and the x variable. Then, the regression line depicts the average association between the variables X and Y. To determine which of the x variables are significant in predicting input into the equation; the equation produces estimations of the dependent variable. When values of the independent variable are entered into the equation, the equation makes measures of the dependent variable. The current study uses Multi Linear Regression model to forecast yearly rainfall in Coimbatore District from 2001 to 2020.

## 2. METHODOLOGY

### Area of study and Data collection

Coimbatore district is in the western part of Tamil Nadu, enclosed by the Western Ghats mountain range on the west and north. The district's boundary is Palakkad in the west, Nilgiris in the north, erode district in the northeast, and south is Idukki. The rest of the section lies in the rain shadow region of the Western Ghats and experiences salubrious climate most parts of the year. The mean maximum and minimum temperatures for Coimbatore city during summer and winter vary between 35 °C to 18 °C. The average annual rainfall in the plains is around 700 mm. The data was collected from the statistical department of Coimbatore from 2001 to 2020.

For this current study weather parameters of the Coimbatore district were used which are Rainfall, Maximum temperature, Minimum temperature and wind speed.

**Table 1: Data collection from 2001 to 2020**

Year	Rainfall(y)	Wind Speed(x1)	Average Temperature(x2)
2001	752.8	18	26.96759259
2002	665.7	18.75	27.03703704
2003	644.7	29.58333333	27.06018519
2004	959.8	18.58333333	27.12962963
2005	973.5	19.41666667	25.18518519
2006	924.6	17.08333333	26.85185185

2007	863.1	14.16666667	26.71296296
2008	725.3	13.25	27.03703704
2009	798.1	14.25	26.96759259
2010	1165.8	14.41666667	26.94444444
2011	1177.8	15.5	26.99074074
2012	902.5	16.33333333	27.08333333
2013	806.6	17.58333333	27.08333333
2014	619.9	20.16666667	27.12962963
2015	1000.7	16.91666667	27.03703704
2016	1418.1	18.25	27.12962963
2017	791.5	18	27.15277778
2018	952	18.83333333	27.10648148
2019	859.5	18	27.03703704
2020	638	18.5	27.10647963

### Multiple Regression

A multiple linear regressions analysis is working out to predict the values of a dependent variable, Y, given a set of k explanatory variables ( $x_1, x_2, \dots, x_k$ ).

$$y = \theta_0 + \theta_1 X_1 + \theta_2 X_2 + \dots + \theta_k X_k + \varepsilon \quad (1)$$

Where  $y \rightarrow$  dependent / response variables

$X_i \rightarrow$  independent / explanatory variables,

$\theta_i \rightarrow$  determine the partial contribution of each of the x variable

$\varepsilon \rightarrow$  is the random error term

$$\theta_1 = \frac{\partial y}{\partial x_1}, \theta_2 = \frac{\partial y}{\partial x_2}, \dots, \theta_k = \frac{\partial y}{\partial x_k}$$

### Three variable model

$$y = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \varepsilon$$

where Y denotes a dependent variable,  $x_1$  denote the first independent variable,  $x_2$  denote the second independent variable

We can obtain the parameter estimates by normalizing the above regression equation.

$$\begin{aligned} \Sigma y &= n\theta_0 + \theta_1 \Sigma x_1 + \theta_2 \Sigma x_2 \\ \Sigma x_1 y &= \theta_0 \Sigma x_1 + \theta_1 \Sigma x_1^2 + \theta_2 \Sigma x_1 x_2 \\ \Sigma x_2 y &= \theta_0 \Sigma x_2 + \theta_1 \Sigma x_1 x_2 + \theta_2 \Sigma x_2^2 \end{aligned}$$

In matrix form

$$\begin{bmatrix} n & \Sigma x_1 & \Sigma x_2 \\ \Sigma x_1 & \Sigma x_1^2 & \Sigma x_1 x_2 \\ \Sigma x_2 & \Sigma x_1 x_2 & \Sigma x_2^2 \end{bmatrix} \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \end{bmatrix} = \begin{bmatrix} \Sigma y \\ \Sigma x_1 y \\ \Sigma x_2 y \end{bmatrix}$$

Using Cramer's rule

$$\theta_1 = \frac{\begin{bmatrix} n & \Sigma y & \Sigma x_2 \\ \Sigma x_1 & \Sigma x_1 y & \Sigma x_1 x_2 \\ \Sigma x_2 & \Sigma x_2 y & \Sigma x_2^2 \end{bmatrix}}{\begin{bmatrix} n & \Sigma x_1 & \Sigma x_2 \\ \Sigma x_1 & \Sigma x_1^2 & \Sigma x_1 x_2 \\ \Sigma x_2 & \Sigma x_1 x_2 & \Sigma x_2^2 \end{bmatrix}}$$

$$\theta_2 = \frac{\begin{bmatrix} n & \Sigma x_1 & \Sigma y \\ \Sigma x_1 & \Sigma x_1^2 & \Sigma x_1 y \\ \Sigma x_2 & \Sigma x_1 x_2 & \Sigma x_2 y \end{bmatrix}}{\begin{bmatrix} n & \Sigma x_1 & \Sigma x_2 \\ \Sigma x_1 & \Sigma x_1^2 & \Sigma x_1 x_2 \\ \Sigma x_2 & \Sigma x_1 x_2 & \Sigma x_2^2 \end{bmatrix}}$$

Multiple Linear Regression in Linear Algebra Notation

$$y = x\theta + \varepsilon$$

$$y = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ \cdot \\ \cdot \\ \cdot \\ y_n \end{bmatrix}$$

The response value for all observations is  $n \times 1$  dimensional vectors.

$$x = \begin{bmatrix} 1 & x_{11} & x_{12} & \cdot & \cdot & x_{1k} \\ 1 & x_{21} & x_{22} & \cdot & \cdot & x_{2k} \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ 1 & x_{n1} & x_{n2} & \cdot & \cdot & x_{nk} \end{bmatrix}$$

The intercept and slopes are  $k \times 1$  dimensional vectors denoted by ' $\theta$ '

$$\theta = \begin{bmatrix} \theta_1 \\ \theta_2 \\ \cdot \\ \cdot \\ \theta_k \end{bmatrix}$$

All the error term has an  $n \times 1$  dimensional vector denoted by  $\varepsilon$

$$\varepsilon = \begin{bmatrix} \varepsilon_1 \\ \varepsilon_2 \\ \cdot \\ \cdot \\ \varepsilon_n \end{bmatrix}$$

Here we use the method of Ordinary Least Square

MLR is  $y = \theta_0 + \theta_1 X_1 + \theta_2 X_2 + \dots + \theta_k X_k + \varepsilon$

Using the OLS method, the objective is to obtain estimates  $(\theta_1, \theta_2, \theta_3, \dots, \theta_k)$  by

Minimizing  $SSE = \Sigma e^2 = \Sigma (y_i - \text{predicted } y)^2$

The parameter estimates are said to be the best linear unbiased estimates can then be used in the prediction equation.

### 3. Result and Discussion :

To establish the multilinear equation using MS Excel under the dependent variable rainfall corresponding to independent variables Temperature and wind speed data from 2001 to 2020.

	Coefficients	Standard Error	t Stat	P-value
Intercept	2792.568685	2957.269022	0.94430661	0.358242
Wind speed	-18.6588644	13.75970183	-1.356051506	0.192823
Average Temperature	-58.61084474	109.2603048	-0.536433107	0.59861

In the rainfall factors, we have used by multiple regression approach. This approach will select rainfall data and other climate factors in the Coimbatore district. Applying a multiple linear regression method to the data set and finding an approximate equation between rainfall and climate variables. So the Estimated MLR is

$$\text{Rainfall} = 2792.57 + (-18.6589 * x_1) + (-58.611 * x_2) \dots \dots \dots (2)$$

From equation (2), we can predict the rainfall for future years by using wind speed and temperature.

**Table: 2 comparisons between Actual and Predict value**

Observation	Actual Rainfall	Predicted Rainfall	Percentage of Error
1	752.8	876.1157431	16.31
2	665.7	858.0513972	28.89
3	644.7	654.5569671	1.53
4	959.8	955.7342779	0.42
5	973.5	954.1507557	1.99
6	924.6	900.0033647	2.66
7	863.1	962.5654476	11.52
8	725.3	860.6751514	18.66
9	798.1	746.0864846	6.52
10	1165.8	1044.3334064	10.42
11	1177.8	1021.4061716	13.27
12	902.5	900.4301878	0.23
13	806.6	877.1066073	8.74
14	619.9	726.1910759	17.15
15	1000.7	992.2593153	0.843
16	1418.1	1452.9538994	2.46
17	791.5	800.2618829	1.107
18	952	952.4262943	0.045
19	859.5	872.0455455	1.45
20	638	658.6460243	3.23

From the above table the percentage of Error is 7.38

**Table: 3 Results of Multi linear regression**

Regression Statistics	
R Square(co efficient of Determination)	0.819648
Adjusted R Square	0.7984
Observations	20

**Figure 1: Comparison between actual and predict value**

#### 4. CONCLUSION:

Regression analysis is a quantitative analysis of the relationship between response and explanatory variables. Multi Linear Regression is an extension of simple Regression. The analysis aims to determine the connection between rainfall and weather variables such as max temperature, min temperature, and wind speed. That is, to examine the functional relationship between the variables and, as a result, to develop a prediction mechanism. This research uses a regression model to explain occurrence analysis with an accuracy of 92.62 percent, which may utilize the model to create yearly precipitation projections. In addition, the precipitation model used provided information regarding the Coimbatore District's water resources and agriculture.

**ABSTRACT:** *In this paper, a mathematical model representing the transmission dynamics of Zika virus between the human ( $S_h, E_h, I_h, R_h$ ) and the vector (mosquito) ( $S_v, E_v, I_v$ ) population are considered. The main objective of this paper is to implement the perturbation techniques such as Homotopy Perturbation Method (HPM) and New Homotopy Perturbation Method (NHPM) to obtain the analytical solution of the model. Each of the parameters involved in the transmission of the Zika virus are analyzed with the help of the perturbation technique. As the recovery rate of the infected human population increases, the human population becomes free from the transmission of the Zika virus.*

**Keywords:** *Transmission dynamics, Human and vector population, Zika virus, Aedes mosquito, Recovery rate, Perturbation techniques.*

## 1. INTRODUCTION:

The Flaviviridae family and Flavivirus species include the Zika virus. Aedes mosquitoes that are active during the day, like *A. aegypti* and *A. albopictus*, transmit it. The Zika Forest in Uganda, where the virus was first discovered in 1947, gave the disease its name. Zika was first discovered in Uganda in 1947 in primates; it was then discovered in people in 1952. Dengue, yellow fever, Japanese encephalitis, and West Nile viruses all belong to the same family as the Zika virus. It has been documented to happen within a constrained equatorial band stretching from Africa to Asia since the 1950s. The Zika virus pandemic of 2015–2016 was caused by the virus' eastward spread across the Pacific Ocean to the Americas between 2007 and 2016. The genome of the zika virus is non-segmented, single-stranded, and 10 kilobases in size. It is also enclosed and icosahedral and has positive-sense RNA genome [1-6].

*Aedes* mosquito species such as *A. africanus*, *A. apicoargenteus*, *A. furcifer*, *A. hensilli*, *A. luteocephalus*, and *A. vittatus* are additionally transmitting the virus, which has an extrinsic incubation time of approximately 10 days in mosquitoes. With only infrequent transmission to people, the virus's host were monkeys and mosquitoes whose cycle is known as the enzootic cycle. *Aedes aegypti* mosquitoes are the main vectors of Zika, but it can also be shared through blood transfusions and sexual contact. Many Zika virus patients will not show any signs or only show minor ones. Fever, rash, headache, joint pain, red eyes, and muscle pain are among the most typical Zika signs. Days to a week can pass between the onsets of symptoms. Diagnosis of Zika is based on a person's recent travel history, symptoms, and test results. A

blood or urine test can confirm a Zika infection. Symptoms of Zika are similar to other illnesses spread through mosquito bites, like dengue and chikungunya. Doctors or other healthcare providers may order tests to look for several types of infections [7-12].

The development of inactivated vaccines and other non-live vaccines that are safe to use in pregnant women has been recommended as a top priority by the World Health Organization. A vaccine against Zika was being developed by 18 companies and institutions as of March 2016, but they estimate it won't be generally accessible for another 10 years. The FDA first approved a human clinical study for a Zika vaccine in June 2016. A DNA vaccine received approval for phase-2 clinical studies in March 2017. This vaccine is made up of a plasmid, a microscopic circular fragment of DNA that expresses the genes for the Zika virus envelope proteins [13-24]. Section 2 provides the mathematical model of the Zika virus as proposed by S.K.Biswas et.al and all the parameters involved in it. Section 3 deals with the perturbation techniques like Homotopy Perturbation and New Homotopy Perturbation methods to derive the analytical solution of the model. In section 4, the analytical solution is verified for its accuracy with the numerical solution using the Matlab software and is represented in the form of graphs which clearly shows the response of the two population, human and vector concerning time under the variation of values in each parameter of the model.

## 2. TRANSMISSION DYNAMICS OF ZIKA VIRUS MATHEMATICAL MODEL

Let the total human population  $N_h(t)$  is classified into four compartments comprised of susceptible human  $S_h(t)$ , exposed human  $E_h(t)$ , infected human  $I_h(t)$  and recovered human  $R_h(t)$ . Here consider a human individual who recovered from the infection of the Zika virus gain lifelong immunity from it. Since only female mosquitoes spreads the Zika infection so the total female mosquito population  $N_v(t)$  is divided into three compartments viz. susceptible mosquitoes  $S_v(t)$ , exposed mosquitoes  $E_v(t)$  and infected mosquitoes  $I_v(t)$ . Again recovery of mosquitoes from Zika infection is not taken into consideration due to its short life span.

Let  $\pi$  be the constant recruitment rate of susceptible humans and  $\mu$  is the natural death rate of the human population. Suppose, susceptible individuals acquire infection due to effective

contact with an infected vector at the rate  $\lambda_1 = \frac{b_2 \alpha_1 I_v}{N_h}, \lambda_2 = \frac{c \alpha_2 I_v}{N_h}$  be the infection due to

sexual interaction with the infected individuals and susceptible humans become aware at a constant,  $a$  & enter into recovered class  $R_h$ . So the total infection strength of humans is  $\lambda_h = \lambda_1 + \lambda_2$ . Here assume that the susceptible mosquitoes acquire infection at a rate  $\lambda_v S_v$  from

infected humans where  $\lambda_v = \frac{b_2 \alpha_3 I_h}{N_h}$ .

The transmission dynamics of the Zika virus between the human and the vector population [25] can be represented by the following system of non-linear differential equations:

$$\frac{dS_h}{dt} = \pi - (\lambda_1 + \lambda_2)S_h - (\mu + a)S_h \quad (2.1)$$

$$\frac{dE_h}{dt} = (\lambda_1 + \lambda_2)S_h - (\sigma + \mu)E_h \quad (2.2)$$

$$\frac{dI_h}{dt} = \sigma E_h - (\gamma + \mu)I_h \quad (2.3)$$

$$\frac{dR_h}{dt} = \gamma I_h - \mu R_h + a S_h \quad (2.4)$$

$$\frac{dS_v}{dt} = \pi_1 - \lambda_v S_v - (\mu_1 + b) S_v \quad (2.5)$$

$$\frac{dE_v}{dt} = \lambda_v S_v - (\sigma_1 + \mu_1 + b) E_v \quad (2.6)$$

$$\frac{dI_v}{dt} = \sigma_1 E_v - (\mu_1 + b) I_v \quad (2.7)$$

The initial condition at the time,  $t=0$ ,  $S_h = S_{h0}$ ,  $E = E_{h0}$ ,  $I_h = I_{h0}$ ,  $R_h = R_{h0}$ ,  $S_v = S_{v0}$ ,

$I_v = I_{v0}$ ,  $E_v = E_{v0}$ .

(2.8)

Parameters	Description
$N_h$	Total human population
$S_h$	Susceptible human population
$E_h$	Exposed human population
$I_h$	Infected human population
$R_h$	Recovered human population
$N_v$	Total vector population
$S_v$	Susceptible vector population
$E_v$	Exposed vector population
$I_v$	Infected vector population
$\pi, \pi_1$	The recruitment rate of humans and mosquitoes respectively
$\mu, \mu_1$	The natural death rate of humans and mosquitoes respectively
$\alpha_1$	Transmission probability per biting of Susceptible humans with infected mosquito
$\alpha_3$	Transmission probability per biting of Susceptible mosquito with infected humans.
$c$	Sexual contact rate between a susceptible human to an infected human
$\alpha_2$	Transmission probability per sexual contact- among a susceptible and infected human
$\sigma$	Progression rate from exposed to infected human
$\gamma$	The recovery rate of infected human
$a$	Rate of awareness in the host population
$\sigma_1$	Progression rate from exposed to infected mosquito
$b$	Constant rate of effective mosquito control

**Table 1 List of Parameters**

### 3 PERTURBATION TECHNIQUES FOR OBTAINING ANALYTICAL SOLUTION

Perturbation techniques like Homotopy Perturbation Method and New Homotopy Perturbation Method [26-31] are used to derive the analytical solution of the Zika virus mathematical model equation from (2.1) to (2.7).

#### 3.1 HOMOTOPY PERTURBATION METHOD

To find the solution of equation (2.1) - (2.7) construct the homotopy as follows:

$$(1-p) \left[ \frac{dS_h}{dt} + (\lambda_1 + \lambda_2)S_h + (\mu + a)S_h \right] + p \left[ \frac{dS_h}{dt} - \pi + (\lambda_1 + \lambda_2)S_h + (\mu + a)S_h \right] = 0 \quad (3.1)$$

$$(1-p) \left[ \frac{dE_h}{dt} + (\sigma + \mu)E_h \right] + p \left[ \frac{dE_h}{dt} - (\lambda_1 + \lambda_2)S_h + (\sigma + \mu)E_h \right] \quad (3.2)$$

$$(1-p) \left[ \frac{dI_h}{dt} + (\gamma + \mu)I_h \right] + p \left[ \frac{dI_h}{dt} - \sigma E_h + (\gamma + \mu)I_h \right] = 0 \quad (3.3)$$

$$(1-p) \left[ \frac{dR_h}{dt} + \mu R_h \right] + p \left[ \frac{dR_h}{dt} + \mu R_h - \gamma I_h - a S_h \right] = 0 \quad (3.4)$$

$$(1-p) \left[ \frac{dS_v}{dt} + \lambda_v S_v + (\mu_1 + b)S_v \right] + p \left[ \frac{dS_v}{dt} - \pi_1 + \lambda_v S_v + (\mu_1 + b)S_v \right] = 0 \quad (3.5)$$

$$(1-p) \left[ \frac{dE_v}{dt} + (\sigma_1 + \mu_1 + b)S_v \right] + p \left[ \frac{dE_v}{dt} - \lambda_v S_v + (\sigma_1 + \mu_1 + b)S_v \right] = 0 \quad (3.6)$$

$$(1-p) \left[ \frac{dI_v}{dt} + (\mu_1 + b)I_v \right] + p \left[ \frac{dI_v}{dt} - \sigma_1 E_v + (\mu_1 + b)I_v \right] = 0 \quad (3.7)$$

The solution of equations (2.1) - (2.7) is written as a power series as follows:

$$S_h = S_{h0} + pS_{h1} + \dots \quad (3.8)$$

$$E_h = E_{h0} + pE_{h1} + \dots \quad (3.9)$$

$$I_h = I_{h0} + pI_{h1} + \dots \quad (3.10)$$

$$R_h = R_{h0} + pR_{h1} + \dots \quad (3.11)$$

$$S_v = S_{v0} + pS_{v1} + \dots \quad (3.12)$$

$$E_v = E_{v0} + pE_{v1} + \dots \quad (3.13)$$

$$I_v = I_{v0} + pI_{v1} + \dots \quad (3.14)$$

Substituting the equations (3.8)-(3.14) in (3.1)-(3.7) we get,

$$(1-p) \left[ \frac{d(S_{h0} + pS_{h1} + \dots)}{dt} + (\lambda_1 + \lambda_2)(S_{h0} + pS_{h1} + \dots) + (\mu + a)(S_{h0} + pS_{h1} + \dots) \right] + p \left[ \frac{dS_h}{dt} - \pi + (\lambda_1 + \lambda_2)(S_{h0} + pS_{h1} + \dots) + (\mu + a)(S_{h0} + pS_{h1} + \dots) \right] = 0 \quad (3.15)$$

$$(1-p) \left[ \frac{d(E_{h0} + pE_{h1} + \dots)}{dt} + (\sigma + \mu)(E_{h0} + pE_{h1} + \dots) \right] + p \left[ \frac{dE_h}{dt} - (\lambda_1 + \lambda_2)(S_{h0} + pS_{h1} + \dots) + (\sigma + \mu)(E_{h0} + pE_{h1} + \dots) \right] = 0 \quad (3.16)$$

$$(1-p) \left[ \frac{d(I_{h0} + pI_{h1} + \dots)}{dt} + (\gamma + \mu)(I_{h0} + pI_{h1} + \dots) \right] + p \left[ \frac{d(I_{h0} + pI_{h1} + \dots)}{dt} - \sigma(E_{h0} + pE_{h1} + \dots) + (\gamma + \mu)(I_{h0} + pI_{h1} + \dots) \right] = 0 \quad (3.17)$$

$$(1-p) \left[ \frac{d(R_{h0} + pR_{h1} + \dots)}{dt} + \mu(R_{h0} + pR_{h1} + \dots) \right] + p \left[ \frac{d(R_{h0} + pR_{h1} + \dots)}{dt} + \mu(R_{h0} + pR_{h1} + \dots) - \gamma(I_{h0} + pI_{h1} + \dots) - a(S_{h0} + pS_{h1} + \dots) \right] = 0 \quad (3.18)$$

$$(1-p) \left[ \frac{d(S_{v0} + pS_{v1} + \dots)}{dt} + \lambda_v(S_{v0} + pS_{v1} + \dots) + (\mu_1 + b)(S_{v0} + pS_{v1} + \dots) \right] + p \left[ \frac{d(S_{v0} + pS_{v1} + \dots)}{dt} - \pi_1 + \lambda_v(S_{v0} + pS_{v1} + \dots) + (\mu_1 + b)(S_{v0} + pS_{v1} + \dots) \right] = 0 \quad (3.19)$$

$$(1-p) \left[ \frac{d(E_{v0} + pE_{v1} + \dots)}{dt} + (\sigma_1 + \mu_1 + b)(E_{v0} + pE_{v1} + \dots) \right] + p \left[ \frac{d(E_{v0} + pE_{v1} + \dots)}{dt} - \lambda_v(S_{v0} + pS_{v1} + \dots) + (\sigma_1 + \mu_1 + b)(E_{v0} + pE_{v1} + \dots) \right] = 0 \quad (3.20)$$

$$(1-p) \left[ \frac{d(I_{v0} + pI_{v1} + \dots)}{dt} + (\mu_1 + b)(I_{v0} + pI_{v1} + \dots) \right] + p \left[ \frac{d(I_{v0} + pI_{v1} + \dots)}{dt} - \sigma_1(E_{v0} + pE_{v1} + \dots) + (\mu_1 + b)(I_{v0} + pI_{v1} + \dots) \right] = 0 \quad (3.21)$$

Comparing the coefficients of  $p^0$  of equations (3.15) - (3.21),

$$p^0 : \left[ \frac{dS_{h0}}{dt} + (\lambda_1 + \lambda_2)S_{h0} + (\mu + a)S_{h0} \right] = 0 \quad (3.22)$$

$$p^0 : \left[ \frac{dE_{h0}}{dt} + (\sigma + \mu)E_{h0} \right] = 0 \quad (3.23)$$

$$p^0 : \left[ \frac{dI_{h0}}{dt} + (\gamma + \mu)I_{h0} \right] = 0 \quad (3.24)$$

$$p^0 : \left[ \frac{dR_{h0}}{dt} + \mu R_{h0} \right] = 0 \quad (3.25)$$

$$p^0 : \left[ \frac{dS_{v0}}{dt} + \lambda_v S_{v0} + (\mu_1 + b)S_{v0} \right] = 0 \quad (3.26)$$

$$p^0 : \left[ \frac{dE_{v0}}{dt} + (\sigma_1 + \mu_1 + b)E_{v0} \right] = 0 \quad (3.27)$$

$$p^0 : \left[ \frac{dI_{v0}}{dt} + (\mu_1 + b)I_{v0} \right] = 0 \quad (3.28)$$

Using the initial condition, the solution of the equations (2.1) - (2.7) is given as follows:

$$S_{h0} = S_{hi} e^{-(\lambda_1 + \lambda_2 + \mu + a)t} \quad (3.29)$$

$$E_{h0} = E_{hi} e^{-(\sigma + \mu)t} \quad (3.30)$$

$$I_{h0} = I_{hi} e^{-(\gamma + \mu)t} \quad (3.31)$$

$$R_{h0} = R_{hi} e^{-\mu t} \quad (3.32)$$

$$S_{v0} = S_{vi} e^{-(\lambda_v + \mu_1 + b)t} \quad (3.33)$$

$$E_{v0} = E_{vi} e^{-(\sigma_1 + \mu_1 + b)t} \quad (3.34)$$

$$I_v = I_{vi} e^{-(\mu_1 + b)t} \quad (3.35)$$

∴ The Solution of Susceptible human ( $S_h$ ), Exposed human ( $E_h$ ), Infected human ( $I_h$ ), Recovered human ( $R_h$ ), Susceptible vector ( $S_v$ ), Exposed vector ( $E_v$ ) and Infected vector ( $I_v$ ) is

$$S_h = S_{hi} e^{-(\lambda_1 + \lambda_2 + \mu + a)t} + \frac{\pi}{\lambda_1 + \lambda_2 + \mu + a} - \frac{\pi}{\lambda_1 + \lambda_2 + \mu + a} e^{-(\lambda_1 + \lambda_2 + \mu + a)t} \quad (3.36)$$

$$E_h = E_{hi} e^{-(\sigma + \mu)t} - \left( \frac{(\lambda_1 + \lambda_2) S_{hi} e^{-(\lambda_1 + \lambda_2 + a + \mu)t}}{\lambda_1 + \lambda_2 + a - \sigma} \right) + \left( \frac{(\lambda_1 + \lambda_2) S_{hi} e^{-(\sigma + \mu)t}}{\lambda_1 + \lambda_2 + a - \sigma} \right) \quad (3.37)$$

$$I_h = I_{hi} e^{-(\gamma + \mu)t} - \left( \frac{\sigma E_{h0} e^{-(\sigma + \mu)t}}{\sigma - \gamma} \right) + \left( \frac{\sigma E_{h0} e^{-(\gamma + \mu)t}}{\sigma - \gamma} \right) \quad (3.38)$$

$$R_h = R_{hi} e^{-(\mu)t} - \left( \frac{\mathcal{N}_{h0} e^{-(\gamma + \mu)t}}{\gamma} \right) - \left( \frac{aS_{h0} e^{-(\lambda_1 + \lambda_2 + \mu + a)t}}{\lambda_1 + \lambda_2 + a} \right) + \left( \left( \frac{\mathcal{N}_{h0}}{\gamma} \right) + \left( \frac{aS_{h0}}{\lambda_1 + \lambda_2 + a} \right) \right) e^{-(\mu)t} \quad (3.39)$$

$$S_v = S_{vi} e^{-(\lambda_v + \mu_1 + b)t} + \left( \frac{\pi_1}{\lambda_v + \mu_1 + b} \right) - \left( \frac{\pi_1}{\lambda_v + \mu_1 + b} \right) e^{-(\lambda_v + \mu_1 + b)t} \quad (3.40)$$

$$E_v = E_{vi} e^{-(\sigma_1 + \mu_1 + b)t} - \left( \frac{\lambda_v S_{vi} e^{-(\lambda_v + \mu_1 + b)t}}{\lambda_v - \sigma_1} \right) + \left( \frac{\lambda_v S_{vi}}{\lambda_v - \sigma_1} \right) e^{-(\sigma_1 + \mu_1 + b)t} \quad (3.41)$$

$$I_v = I_{vi} e^{-(\mu_1 + b)t} - \left( \frac{\sigma_1 E_{v0} e^{-(\sigma_1 + \mu_1 + b)t}}{\sigma_1} \right) + \left( \frac{\sigma_1 E_{v0}}{\sigma_1} \right) e^{-(\mu_1 + b)t} \quad (3.42)$$

### 3.2 NEW HOMOTOPY PERTURBATION METHOD

To find the solution of equation (2.1) - (2.7) by the new homotopy as follows:

$$(1-p) \left[ \frac{dS_h}{dt} - \pi + (\lambda_1 + \lambda_2)S_h + (\mu + a)S_h \right] + p \left[ \frac{dS_h}{dt} - \pi + (\lambda_1 + \lambda_2)S_h + (\mu + a)S_h \right] = 0 \quad (3.43)$$

$$(1-p) \left[ \frac{dE_h}{dt} - (\lambda_1 + \lambda_2)S_h(t=0) + (\sigma + \mu)E_h \right] + p \left[ \frac{dE_h}{dt} - (\lambda_1 + \lambda_2)S_h + (\sigma + \mu)E_h \right] = 0 \quad (3.44)$$

$$(1-p) \left[ \frac{dI_h}{dt} - \sigma E_h(t=0) + (\gamma + \mu)I_h \right] + p \left[ \frac{dI_h}{dt} - \sigma E_h + (\gamma + \mu)I_h \right] = 0 \quad (3.45)$$

$$(1-p) \left[ \frac{dR_h}{dt} + \mu R_h - \gamma I_h(t=0) - aS_h(t=0) \right] + p \left[ \frac{dR_h}{dt} + \mu R_h - \gamma I_h - aS_h \right] = 0 \quad (3.46)$$

$$(1-p) \left[ \frac{dS_v}{dt} + \lambda_v S_v + (\mu_1 + b)S_v \right] + p \left[ \frac{dS_v}{dt} - \pi_1 + \lambda_v S_v + (\mu_1 + b)S_v \right] = 0 \quad (3.47)$$

$$(1-p) \left[ \frac{dE_v}{dt} - \lambda_v S_v(t=0) + (\sigma_1 + \mu_1 + b)E_v \right] + p \left[ \frac{dE_v}{dt} - \lambda_v S_v + (\sigma_1 + \mu_1 + b)E_v \right] = 0 \quad (3.48)$$

$$(1-p) \left[ \frac{dI_v}{dt} - \sigma_1 E_v(t=0) + (\mu_1 + b)I_v \right] + p \left[ \frac{dI_v}{dt} - \sigma_1 E_v + (\mu_1 + b)I_v \right] = 0 \quad (3.49)$$

The solution of equations (2.1) - (2.7) is written as a power series as follows:

$$S_h = S_{h0} + pS_{h1} + \dots \quad (3.50)$$

$$E_h = E_{h0} + pE_{h1} + \dots \quad (3.51)$$

$$I_h = I_{h0} + pI_{h1} + \dots \quad (3.52)$$

$$R_h = R_{h0} + pR_{h1} + \dots \quad (3.53)$$

$$S_v = S_{v0} + pS_{v1} + \dots \quad (3.54)$$

$$E_v = E_{v0} + pE_{v1} + \dots \quad (3.55)$$

$$I_v = I_{v0} + pI_{v1} + \dots \quad (3.56)$$

Substituting the equations (3.50)-(3.56) in (3.43)-(3.49) we get,

$$(1-p) \left[ \frac{d(S_{h0} + pS_{h1} + \dots)}{dt} + (\lambda_1 + \lambda_2)(S_{h0} + pS_{h1} + \dots) + (\mu + a)(S_{h0} + pS_{h1} + \dots) \right] + p \left[ \frac{dS_h}{dt} - \pi + (\lambda_1 + \lambda_2)(S_{h0} + pS_{h1} + \dots) + (\mu + a)(S_{h0} + pS_{h1} + \dots) \right] = 0 \quad (3.57)$$

$$(1-p) \left[ \frac{d(E_{h0} + pE_{h1} + \dots)}{dt} - (\lambda_1 + \lambda_2)S_h(t=0) + (\sigma + \mu)(E_{h0} + pE_{h1} + \dots) \right] + p \left[ \frac{dE_h}{dt} - (\lambda_1 + \lambda_2)(S_{h0} + pS_{h1} + \dots) + (\sigma + \mu)(E_{h0} + pE_{h1} + \dots) \right] = 0 \quad (3.58)$$

$$(1-p) \left[ \frac{d(I_{h0} + pI_{h1} + \dots)}{dt} - \sigma E_h(t=0) + (\gamma + \mu)(I_{h0} + pI_{h1} + \dots) \right] \\ + p \left[ \frac{d(I_{h0} + pI_{h1} + \dots)}{dt} - \sigma(E_{h0} + pE_{h1} + \dots) + (\gamma + \mu)(I_{h0} + pI_{h1} + \dots) \right] = 0 \quad (3.59)$$

$$(1-p) \left[ \frac{d(R_{h0} + pR_{h1} + \dots)}{dt} + \mu(R_{h0} + pR_{h1} + \dots) - \gamma I_h(t=0) - aS_h(t=0) \right] \\ + p \left[ \frac{d(R_{h0} + pR_{h1} + \dots)}{dt} + \mu(R_{h0} + pR_{h1} + \dots) - \gamma(I_{h0} + pI_{h1} + \dots) - a(S_{h0} + pS_{h1} + \dots) \right] = 0 \quad (3.60)$$

$$(1-p) \left[ \frac{d(S_{v0} + pS_{v1} + \dots)}{dt} + \lambda_v(S_{v0} + pS_{v1} + \dots) + (\mu_1 + b)(S_{v0} + pS_{v1} + \dots) \right] \\ + p \left[ \frac{d(S_{v0} + pS_{v1} + \dots)}{dt} - \pi_1 + \lambda_v(S_{v0} + pS_{v1} + \dots) + (\mu_1 + b)(S_{v0} + pS_{v1} + \dots) \right] = 0 \quad (3.61)$$

$$(1-p) \left[ \frac{d(E_{v0} + pE_{v1} + \dots)}{dt} - \lambda_v S_v(t=0) + (\sigma_1 + \mu_1 + b)(E_{v0} + pE_{v1} + \dots) \right] \\ + p \left[ \frac{d(E_{v0} + pE_{v1} + \dots)}{dt} - \lambda_v(S_{v0} + pS_{v1} + \dots) + (\sigma_1 + \mu_1 + b)(E_{v0} + pE_{v1} + \dots) \right] = 0 \quad (3.62)$$

$$(1-p) \left[ \frac{d(I_{v0} + pI_{v1} + \dots)}{dt} - \sigma_1 E_v(t=0) + (\mu_1 + b)(I_{v0} + pI_{v1} + \dots) \right] \\ + p \left[ \frac{d(I_{v0} + pI_{v1} + \dots)}{dt} - \sigma_1(E_{v0} + pE_{v1} + \dots) + (\mu_1 + b)(I_{v0} + pI_{v1} + \dots) \right] = 0 \quad (3.63)$$

Comparing the coefficients of  $p^0$  from equations (3.57) - (3.63),

$$p^0 : \left[ \frac{dS_{h0}}{dt} + (\lambda_1 + \lambda_2)S_{h0} + (\mu + a)S_{h0} \right] = \pi \quad (3.64)$$

$$p^0 : \left[ \frac{dE_{h0}}{dt} + (\sigma + \mu)E_{h0} \right] = (\lambda_1 + \lambda_2)S_{h0} \quad (3.65)$$

$$p^0 : \left[ \frac{dI_{h0}}{dt} + (\gamma + \mu)I_{h0} \right] = \sigma E_{h0} \quad (3.66)$$

$$p^0 : \left[ \frac{dR_{h0}}{dt} + \mu R_{h0} \right] = \gamma I_h + aS_{h0} \quad (3.67)$$

$$p^0 : \left[ \frac{dS_{v0}}{dt} + \lambda_v S_{v0} + (\mu_1 + b)S_{v0} \right] = \pi_1 \quad (3.68)$$

$$p^0 : \left[ \frac{dE_{v0}}{dt} + (\sigma_1 + \mu_1 + b)E_{v0} \right] = \lambda_v S_{v0} \quad (3.69)$$

$$p^0 : \left[ \frac{dI_{v0}}{dt} + (\mu_1 + b)I_{v0} \right] = \sigma_1 E_{v0} \quad (3.70)$$

∴ The Solution of Susceptible human ( $S_h$ ), Exposed human ( $E_h$ ), Infected human ( $I_h$ ), Recovered human ( $R_h$ ), Susceptible vector ( $S_v$ ), Exposed vector ( $E_v$ ) and Infected vector ( $I_v$ ) is

$$S_h = \frac{\pi}{\lambda_1 + \lambda_2 + \mu + a} + \left( S_{h0} - \frac{\pi}{\lambda_1 + \lambda_2 + \mu + a} \right) e^{-(\lambda_1 + \lambda_2 + \mu + a)t} \quad (3.71)$$

$$E_h = \frac{(\lambda_1 + \lambda_2)S_{h0}}{\sigma + \mu} + \left( E_{h0} - \frac{(\lambda_1 + \lambda_2)S_{h0}}{\sigma + \mu} \right) e^{-(\sigma + \mu)t} \quad (3.72)$$

$$I_h = \frac{\sigma E_{h0}}{\gamma + \mu} + \left( I_{h0} - \frac{\sigma E_{h0}}{\gamma + \mu} \right) e^{-(\gamma + \mu)t} \quad (3.73)$$

$$R_h = \frac{\gamma I_{h0} + a S_{h0}}{\mu} + \left( R_{h0} - \frac{\gamma I_{h0} + a S_{h0}}{\mu} \right) e^{-\mu t} \quad (3.74)$$

$$S_v = \frac{\pi_1}{\lambda_v + \mu_1 + b} + \left( S_{v0} - \frac{\pi_1}{\lambda_v + \mu_1 + b} \right) e^{-(\lambda_v + \mu_1 + b)t} \quad (3.75)$$

$$E_v = \frac{\lambda_v S_{v0}}{\sigma_1 + \mu_1 + b} + \left( E_{v0} - \frac{\lambda_v S_{v0}}{\sigma_1 + \mu_1 + b} \right) e^{-(\sigma_1 + \mu_1 + b)t} \quad (3.76)$$

$$I_v = \frac{\sigma_1 E_{v0}}{\mu_1 + b} + \left( I_{v0} - \frac{\sigma_1 E_{v0}}{\mu_1 + b} \right) e^{-(\mu_1 + b)t} \quad (3.77)$$

#### 4. RESULTS AND DISCUSSIONS:

The analytical solution of the system of equations of the susceptible human population, the exposed human population, the infected human population, the recovered human population, the susceptible vector population, the exposed vector population, infected vector population (2.1) - (2.7) are given in equations (3.36) - (3.42) & (3.71) - (3.77) using homotopy perturbation & new homotopy perturbation respectively and is compared with its numerical simulation.

Figure 1(a)

Figure 2(b)

**Figure 1(a) and 1(b):** Figure 1(a) and 1(b) represent the susceptible human population  $S_h$  versus time  $t$  for the parameter, the recruitment rate of humans ( $\pi$ ) and the natural death rate of humans ( $\mu$ ). In the graph, the dashed and the star line represent the analytical solution

equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figures (1(a)) & (1(b)) see that the susceptible population rate versus time for the human population rate reduces for the lost values of the recruitment rate of humans ( $\pi$ ) and natural death rate of human ( $\mu$ ) for the time and the other parameters are remain fixed.

**Figure 2(a)**

**Figure 2(b)**

**Figure 2(a) and 2(b):** Figure 2(a) and 2(b) represent the exposed human population  $E_h$  versus time for the parameter, the progression rate from exposed to infected human ( $\sigma$ ) and the natural death rate of humans ( $\mu$ ). In the graph, the dashed and the star line represent the analytical solution equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figures (2(a)) & (2(b)) state that the exposed population rate versus time for the human population rate diminishes for the shrink values of progression rate from exposed to infected human ( $\sigma$ ) and natural death rate of human ( $\mu$ ) for the time and the left out parameters are kept stable.

**Figure 3(a)**

**Figure 3(b)**

**Figure 3(a) and 3(b):** Figure 3(a) and 3(b) represent the infected human population  $I_h$  versus time for the parameter, the recovery rate of infected human ( $\gamma$ ) and the natural death rate of

human ( $\mu$ ). In the graph, the dashed and the star line represent the analytical solution equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figures (3(a)) & (3(b)) observe that the infected population rate versus time for the human population rate increase for the decreased values of the recovery rate of infected humans ( $\gamma$ ) and the increased values of natural death rate of human ( $\mu$ ) for the time and the leftover parameters are still static.

Figure 4(a)

Figure 4(b)

**Figure 4(a) and 4(b):** Figure 4(a) and 4(b) represents the recovered human population  $R_h$  versus time for the parameter, the natural death rate of humans ( $\mu$ ) and the recovery rate of infected humans ( $\gamma$ ). In the graph, the dashed and the star line represent the analytical solution equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figure (4(a)) notice that the recovered population rate versus time for the human population rate grows for the falling value natural death rate of humans ( $\mu$ ) for the time and  $\gamma$  &  $a$  stay constant. From Figure (4(b)) show that the recovered population rate versus time for the human population rate goes down for the dwindling value of recovery rate of infected human ( $\gamma$ ) for the time and  $\mu$  &  $a$  retain permanently.

Figure 5(a)

Figure 5(b)

**Figure 5(a) and 5(b):** Figure 5(a) and 5(b) represents the susceptible vector population  $S_v$  versus time for the parameter, susceptible mosquitoes acquire infection from infected human ( $\lambda_v$ ) and the recruitment rate of mosquitoes ( $\pi_1$ ). In the graph, the dashed and the star line represent the analytical solution equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figure 5(a) & 5(b) describe that the susceptible vector population rate versus time for the mosquitoes population rate go narrow for the drop values of susceptible mosquitoes acquiring infection from infected human ( $\lambda_v$ ) & recruitment rate of mosquitoes ( $\pi_1$ ) for the time and residual parameters hold solid.

**Figure 6(a)**

**Figure 6(b)**

**Figure 6(a) and 6(b):** Figure 6(a) and 6(b) represents the exposed vector population  $E_v$  versus time for the parameter, the progression rate from exposed to infected mosquitoes ( $\sigma_1$ ) and the natural death rates of mosquitoes ( $\mu_1$ ). In the graph, the dashed and the star line represent the analytical solution equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figures 6(a) & 6(b) sketch that the exposed vector population rate versus time for the mosquitoes population rate declined for the shortened values of progression rate from exposed to infected ( $\sigma_1$ ) & natural death rate of mosquitoes ( $\mu_1$ ) for the time and rest parameters sustain rigidly.

**Figure 7(a)**

**Figure 7(b)**

**Figure 7(a) and 7(b):** Figure 7(a) and 7(b) represents the infected vector population  $I_v$  versus time for the parameter, the natural death rate of mosquitoes ( $\mu_1$ ) and the constant rate of effective mosquito control ( $b$ ). In the graph, the dashed and the star line represent the analytical solution equation of (HPM) & (NHPM) respectively and the dotted line represents the numerical solution.

From Figure (7(a)) tells that the infected vector population rate versus time for the mosquito population rate lessens for the lower value of natural death rate of mosquitoes ( $\mu_1$ ) for the time and  $b$  &  $\sigma_1$  reserve stationary. And Figure (7(b)) explains that the infected vector population rate versus time for the mosquito population rate plunge for the rising value of the constant rate of effective mosquito control ( $b$ ) for the time and  $\mu_1$  &  $\sigma_1$  parameters perpetuate steady.

## 5. CONCLUSION:

Thus the system of non-linear differential equations on the susceptible human population, exposed human population, infected human population, recovered human population, susceptible vector population, exposed vector population and infected vector population have been solved using the Homotopy Perturbation method (HPM) & New Homotopy Perturbation method (NHPM) and the meticulous of the approximate analytical solution has been verified by comparison with its numerical simulation. Thus the analytic result helps us to understand the effect of various parameters on the Zika virus model.

## 6. ACKNOWLEDGEMENT

The author(s) declare that they have not received any fund or grant from any institution for their research work.

## 7. CONFLICTS OF INTEREST

Both the author(s) confirm that they have no conflicts of interest.

**ABSTRACT:** *Connectedness and compactness are useful and fundamental notions. Connectedness is one of the principal topological property that are used to distinguish topological spaces. Compactness is a way to generalize the properties of finite sets to more general sets. In this paper we define these two fundamental concepts on TSBF-algebras and prove some of properties on it.*

## 1. INTRODUCTION:

In this paper, we define two fundamental concepts compactness and connectedness on TSBF-algebras in more easier way with the help of identity element of a BF-algebra. We give the simpler form of the definitions of compactness and connectedness. Also we discuss the necessary condition for separation axioms  $T_0, T_1$  and  $T_2$  to hold on TSBF-algebras.

## 2. PRELIMINARIES :

**Definition 2.1.** [2] A BF-algebra is an algebra  $(X, *, 0)$  of type  $(2, 0)$  satisfying the following conditions:

1.  $x * x = 0$ .
2.  $x * 0 = x$ .
3.  $0 * (x * y) = y * x, \forall x, y \in X$ .

**Definition 2.2.**[9] Let  $(F, A)$  be a soft BF-algebra over  $X$  and  $\tau$  be a soft BF-topology on  $X$ . Let  $x \in A$ . Then  $(F, A, \tau)$  is said to be a topological soft BF-algebra over  $X$  with respect to  $F(x)$ , if for every  $a, b \in F(x)$  and any open set  $W$  of  $a * b$ , there exist open sets  $U$  and  $V$  of  $a$  and  $b$  respectively such that  $U * V \subseteq W$ . That is, a function  $f$  from  $F(a) \times F(a)$  into  $F(a)$  is continuous with respect to a topology  $\tau$  on  $X$ , since  $F(a)$  is a subalgebra of  $X$ .

**Definition 2.2.1** [9] Let  $(F, A, \tau)$  be a topological soft BF-algebra (TSBF-algebra) over a BF-algebra  $X$  with respect to  $F(a), a \in A$ . Then  $(F, A, \tau)$  is said to be a topological soft BF1 algebra (TSBF1-algebra) over  $X$  with respect to  $F(a)$ , if  $x = (x * y) * (0 * y)$ , for all  $x, y \in X$ .

**Theorem 2.3.**[8] Let  $(F, A, \tau)$  be a TSBF-algebra with respect to  $F(a)$  over  $X$ , and  $\{G_\alpha\}_{\alpha \in I}$  be the collection of open sets contained in  $F(a)$ ,  $I$  is an index set. Then, arbitrary intersection of open sets  $G_\alpha$ 's is open.

**Theorem 2.4.**[10] Let  $(F, A, \tau)$  be a TSBF1-algebra with respect to  $F(a)$  over  $X$ . Then the smallest open set for  $0$ , is a subalgebra of  $X$ .

### 3. CONNECTEDNESS :

#### Definition 3.1

Let  $(F, A, \tau)$  be a  $TSBF_1$ - algebra with respect to  $F(a)$  over  $X$ , and  $S \subseteq X$ . Then  $S$  is said to be separated if  $S = A \cup B$ , where  $A$  and  $B$  are the non-empty disjoint open sets in  $X$ . If  $S$  is not separated then  $S$  is connected.

#### Remark 3.2

1. If  $U \& V$  are connected subsets of  $X$  then  $U * V$  is also connected.
2. The left map  $l_a, a \in F(a)$  maps connected sets into connected sets.

**Theorem 3.3.** Let  $(F, A, \tau)$  be a  $TSBF_1$ - algebra with respect to  $F(a)$  over  $X$ . Then,

1. If  $0$  is an interior point of  $F(a)$ , then  $F(a)$  is separated.
2. If  $0$  is not an interior point of  $F(a)$ , then  $F(a)$  is connected and every subset  $S$  of  $F(a)$  is also connected.
3. If  $0$  is not an interior point of  $F(a)$ , then (the least open set of  $0$ )  $L_0$  is connected.

**Proof:** (1). Assume  $0$  is an interior point of  $F(a)$ . So, every  $x \in F(a)$  is an interior point of  $F(a)$ . Then  $F(a)$  can be written as finite union of open sets.

$\implies F(a) = \cup_{\{x \in F(a)\}} L_x = L_0 \cup_{\{x \in F(a) - L_0\}} L_x$ . Therefore,  $F(a)$  is separated.

(2) Assume  $0$  is not an interior point of  $F(a)$ .  $\text{Int } F(a) = \emptyset$ . Implies, there is no open set contained in  $F(a)$ ... (1). Therefore,  $F(a)$  cannot be separated into union of two disjoint open sets.... (2). Hence,  $F(a)$  is connected.

(3). Now, (1) & (2) is true for every  $S \subseteq F(a)$  and  $L_0$ . So,  $S$  and  $L_0$  is connected.

**Theorem 3.4.** Let  $(F, A, \tau)$  be a  $TSBF_1$ - algebra with respect to  $F(a)$  over finite  $X$ . Then,  $F(a)$  is connected if  $0 \in \cap_{\{U_\alpha \in \tau - \{\emptyset\}\}} U_\alpha$ .

**Proof:** Since  $0$  belongs to all open sets  $U_\alpha$  of  $X$  except  $\emptyset$  and from lemma 3.1.16, we have  $F(a) \subseteq U_\alpha$ , for all  $U_\alpha \in \tau - \{\emptyset\}$ . So,  $F(a)$  cannot be written as disjoint union of two non-empty open sets contained in  $F(a)$ . Hence,  $F(a)$  is connected.

**Theorem 3.5.** Let  $(F, A, \tau)$  be a  $TSBF_1$ - algebra with respect to  $F(a)$  over finite  $X$  with the condition  $0 * x = x$ , for all  $x \in X$  and let  $0$  be an interior point of  $F(a)$ . If  $(m, n) = 1$  where  $o(F(a)) = n$  and  $o(S) = m$ , then  $S$  is connected where  $S \subseteq F(a)$ .

**Proof:** Let  $S \subseteq F(a)$ . Then,  $o(F(a))$  and  $o(L_0)$  is even.  $o(L_x)$  is even.

Since  $(m, n) = 1$ , then  $o(S)$  is odd. Suppose  $S$  is not connected. Then,  $S = A \cup B$ , where  $A$  and  $B$  are disjoint non-empty open sets. Since  $X$  is finite, the smallest open set for every  $x \in X$  is open.

Therefore,  $S = (\cup_{\{x \in A\}} L_x) \cup (\cup_{\{x \in B\}} L_x) = \cup_{\{x \in A \cup B\}} L_x = \cup_{\{x \in S\}} L_x$ . Then,  $o(S) = \cup_{\{x \in S\}} o(L_x)$  is even, which is a contradiction to the fact that  $o(S)$  is odd. Hence,  $S$  is connected.

**Theorem 3.6.** Let  $(F, A, \tau)$  be a  $TSBF_1$ - algebra with respect to  $F(a)$  over  $X$ , with the condition that  $0 * x = x, \forall x \in X$ . If there exist an open ideal contained in  $F(a)$ , then  $F(a)$  is not connected.

**Proof:** Let  $I$  be an open ideal contained in  $F(a)$  and  $x \in (F(a) - I)$  Since  $0 \in I$  &  $x * x = 0$ , there exist open sets  $U$  and  $V$  of  $x$  such that,  $U * V \subseteq I$ ... (1) If  $V \subseteq (F(a) - I)$  then  $F(a)$  is separated. If not, there exist an element say  $y, y \in V$  and  $y / \in (F(a) - I)$ .

Case(i): Let  $y \in I^c$  and  $y \notin F(a)$ . (1) implies,  $x * y \in F(a)$ . From lemma 2.2.12,  $y \in F(a)$ . Therefore,  $y \in F(a)$  for all  $y \in V$ .

Case(ii): Let  $y \notin I^c$  and  $y \in F(a)$ . So,  $y \in I$ . (1) implies,  $x*y \in I$ . Since  $I$  is ideal,  $x \in F(a)$ . This is a contradiction. Therefore, in both cases we can conclude that,  $y \in F(a)-I$  for all  $y \in V$ .

**Theorem 3.7.** Let  $(F,A,\tau)$  be a TSBF– algebra with respect to  $F(a)$  and  $S \subseteq F(a)$ .  $S$  is disconnected if and only if  $S = \bigcup_{\{x \in S\}} L_x$ .

**Proof:** Let  $S$  be any subset of  $F(a)$ . Assume,  $S = \bigcup_{\{x \in S\}} L_x$ . Clearly,  $L_x \cap L_y = \emptyset, \forall x, y \in F(a)$ .  $S = L_x \cup \left( \bigcup_{\{y \in S - L_x\}} L_y \right)$ . Therefore,  $S$  is disconnected.

Conversely, assume  $S$  is disconnected.

$\implies S = A \cup B$ , where  $A$  and  $B$  are open and  $A \cap B = \emptyset, B \cap A = \emptyset$ . Clearly,  $A \& B \subseteq F(a)$ . Implies, the smallest open set for every  $x$  in  $A$ , is contained in  $A$ . So,  $A = \bigcup_{\{x \in A\}} L_x$ . Similarly, we can write,  $B = \bigcup_{\{x \in B\}} L_x$ . Therefore,  $S = \left( \bigcup_{\{x \in A\}} L_x \right) \cup \left( \bigcup_{\{x \in B\}} L_x \right) = \bigcup_{\{x \in A \cup B\}} L_x = \bigcup_{\{x \in S\}} L_x$ .

**Theorem 3.8.** Let  $(F,A,\tau)$  be a  $TSBF_1$ – algebra with respect to  $F(a)$  over  $X$ , with the condition that  $0*x = x, \forall x \in X$ . If  $B \subseteq F(a)$  is connected then the image of  $B$  under the left map restricted to  $F(a)$   $l_p, p \in F(a)$  is connected.

**Proof:** The proof of this theorem follows from continuous image of connected set is connected.

**Theorem 3.9.** Let  $(F,A,\tau)$  be a  $TSBF_1$ – algebra with respect to  $F(a)$  over  $X$ , with the condition that  $0*x = x, \forall x \in X$ . If  $S \subseteq F(a)$  is separated then the image of  $S$  under the left map  $l_p, p \in F(a)$  is separated.

**Proof:** Let  $S$  be a separated set in  $X$ . Then  $S = A \cup B$ , where  $A$  and  $B$  are disjoint open subsets of  $X$ . Now,  $l_p(S) = p*S$ . Now,  $p*S = p*(A \cup B) = (p*A) \cup (p*B)$ . Since  $A$  and  $B$  are open,  $p*A$  and  $p*B$  is open. Since  $A \cap B$  is empty, we have  $(p*A) \cap (p*B) = \emptyset$ . Therefore, the image of  $S$  under the left map  $l_p, p \in F(a)$  is separated.

#### 4. COMPACTNESS :

##### Definition 4.1.

Let  $(F,A,\tau)$  be a TSBF–algebra with respect to  $F(a)$  over  $X$  and  $C \subseteq X$ . A collection  $A$  of subsets of a space  $X$  is said to cover  $C$ , or to be a covering of  $C$ , if the union of the elements of  $A$  is equal to  $C$ . It is called open covering of  $C$  if its elements are open subsets in  $X$ .

**Definition 4.2.** Let  $(F,A,\tau)$  be a TSBF–algebra with respect to  $F(a)$  over  $X$ . A space  $X$  is said to be compact if every open covering  $A$  of  $X$  contains finite subcollection that also covers  $X$ .

**Theorem 4.3.** Let  $(F,A,\tau)$  be a TSBF–algebra with respect to  $F(a)$  over  $X$  and  $C \subseteq F(a)$  is compact. Then image of  $C$  under a left map is compact.

**Proof :** Since for every left map  $l_a, a \in F(a)$  restricted to  $F(a)$  is continuous,  $l_a(C)$  is compact.

**Theorem 4.4.** Let  $(F,A,\tau)$  be a TSBF–algebra with respect to  $F(a)$  over  $X$  and  $C \subseteq F(a)$  is compact if and only if  $C = \bigcup_{i=1}^n L_{x_i}$ .

**Proof:** Assume,  $C$  is compact. Since for every  $x \in C$ , the smallest open set  $L_x$  is open, the collection  $L = \{L_x / x \in C\}$  of smallest open sets covers  $C$ . Therefore, the collection  $L$  has a finite sub cover say  $L_{x_1}, L_{x_2}, \dots, L_{x_n}$  that also covers  $C$ . Hence,  $C \subseteq \bigcup_{i=1}^n L_{x_i}$ .

Conversely, assume,  $C \subseteq \bigcup_{i=1}^n L_{x_i}$ . Let  $\mathbb{A}$  be an open covering of  $C$ . Let  $x \in C$ , there is at least one element say  $A_1 \in \mathbb{A}$  Clearly, the smallest open set  $L_x \subseteq A_1$ . For every  $x \in C$ , there is an element  $A_x \in \mathbb{A}$  and  $L_x \subseteq A_{x_i}$ . Since  $C \subseteq \bigcup_{i=1}^n L_{x_i} \subseteq \bigcup_{i=1}^n A_{x_i}$ . Implies,  $C \subseteq \bigcup_{i=1}^n A_{x_i}$ . Therefore, the open cover  $\mathbb{A}$  has finite subcover that covers  $C$ . Hence,  $C$  is compact.

**Theorem 4.5** Let  $(F, A, \tau)$  be a  $TSBF_1$ -algebra with respect to  $F(a)$  over  $X$  with the property that,  $0 * x = x, \forall x \in X$  and  $C_1, C_2, \dots, C_n \subseteq F(a)$  are compact. Then  $C_1 * C_2 * \dots * C_n$  is compact.

**Proof:** We want to prove this theorem by induction on  $n$ .

Let  $n = 2$ . Let  $C_1, C_2 \subseteq F(a)$  are compact. From theorem 2.4,  $C_1 \subseteq \bigcup_{i=1}^n L_{x_i}$  and  $C_2 \subseteq \bigcup_{i=1}^m L_{y_i}$ , where  $x_i \in C_1$  and  $y_i \in C_2$ . Let  $z \in C_1 * C_2$ . So,  $z = x * y$ , where  $x \in C_1$  and  $y \in C_2$ .  $L_z = L_{\{x * y\}} = L_x * L_y$ . Implies,  $L_{x_i} * L_{y_i} = L_{z_i}$ . Let  $k = \max\{n, m\}$ . Therefore,  $C_1 * C_2 \subseteq \bigcup_{i=1}^k L_{z_i}$ , where  $L_{z_i}$  is the smallest open set for  $z_i \in C_1 * C_2$ . From theorem, 2.4,  $C_1 * C_2$  is compact.....(1). Assume,  $C_1 * C_2 * \dots * C_{n-1}$  is compact.....(2). For  $n$ ,  $C_1 * C_2 * \dots * C_n = (C_1 * C_2 * \dots * C_{n-1}) * C_n$  is compact.

**Remark 4.6.**

1. Finite union of compact set is compact.
2. Arbitrary intersection of compact set is compact.

**Theorem 4.7.** Let  $(F, A, \tau)$  be a  $TSBF_1$ -algebra with respect to  $F(a)$  over  $X$  with the property that,  $0 * x = x, \forall x \in X$ . Arbitrary union of compact sets contained in  $F(a)$  is compact.

**Proof:** From theorem 3.17 and theorem 2.3 we can prove this theorem.

**Remark 4.8.**

In above theorem 4.7, put  $F(a) = X$ , then arbitrary union of compact subsets of  $X$  is compact.

**Theorem 4.9.** Let  $(F, A, \tau)$  be a  $TSBF_1$ -algebra with respect to  $F(a)$  over  $X$ . If  $0$  is not an interior point of  $F(a)$ , then every subset of  $F(a)$  is compact.

**Proof:** Assume,  $0$  is not an interior point of  $F(a)$ . From theorem 4.7, there is no interior points of  $F(a)$ . Let  $A \subseteq F(a)$ . Therefore, every open cover of  $A$  has a finite sub cover that also covers  $A$ .  $A$  is compact.

**Theorem 4.10.** Let  $(F, A, \tau)$  be a  $TSBF_1$ -algebra with respect to  $F(a)$  over  $X$  and  $B \subseteq F(a)$ . If  $\text{Int}B = \emptyset$ , then  $B$  is compact.

**Proof:** Let  $B \subseteq F(a)$ . Since  $\text{Int}B = \emptyset$ ,  $0$  is not an interior point of  $B$  and  $F(a)$ .

From theorem 4.9,  $B$  is compact.

**Theorem 4.11.** Let  $(F, A, \tau)$  be a  $TSBF_1$ -algebra with respect to  $F(a)$  over  $X$  and  $0$  belongs to every open set of  $x \in A$ . Then every subset of  $F(a)$  is compact.

**Proof:** Let  $B \subseteq F(a)$ . ,  $\text{Int}B = \emptyset$ .

From theorem 4.9,  $B$  is compact.

**Remark 4.12.**

1. The smallest open set for  $x \in F(a)$  is compact.
2. Every open subspace of compact space is compact.
3. Compact sets are separated.
4. If  $0$  is not a limit point of a set  $S \subseteq F(a)$ , then  $S$  is compact.
5. Finite cross product of compact sets is compact.

# Anti multi fuzzy BH-ideals in BH-algebras

K. Anitha

Assistant Professor, Department of Mathematics,  
Sri Krishnasamy Arts and Science College, Sattur - 626 203, Tamil Nadu,  
India. Mail id:[anithamaths19@gmail.com](mailto:anithamaths19@gmail.com)

**ABSTRACT:** In this paper we speak approximately the Anti multi fuzzy BH-Ideals and associated homes in BH-Algebras. Multi Fuzzy set concept is a extension of fuzzy set concept. These offers with the multi-dimensional fuzziness. we introduce the perception of Anti multi-fuzzy BH-ideals, the Anti multi-level subset of BH-ideals. And additionally we outline a few associated Anti multi-fuzzy BH-ideals based on level subset of it.

**KEYWORDS:** BH-algebra, Anti Fuzzy BH-ideal, Anti Multi-fuzzy BH-ideal. Anti Multi fuzzy closed ideal.

**Subject Classification:** AMS (2000), 06F35, 03G25, 06D99, 03B47

## 1. INTRODUCTION:

Y. Imai and K. Iseki [1,2&3] are brought lessons of summary algebras. BCK- algebras and BCI-algebras. It is understood that the elegance of BCK-algebras is a right subclass of the elegance of BCI-algebras. K. Iseki and S. Tanaka [4] are brought creation to concept of BCK-algebras. L.A. Zadeh [5] are brought fuzzy units. S. Sabu and T.V. Ramakrishnan[6] are brought Multi-Fuzzy units, The preception of BH-algebras is brought with the aid of using J.B. Jun, E.H. Roh and H.S. Kim[7] .Since then, numerous authors have studied BH-algebras. In particular, Q. Zhang, E.H. Roh and Y.B. Jun [8] studied the fuzzy concept in BH-algebras. K. Anitha and N. Kandaraj [9] are brought Fuzzy subalgebras on BH-algebras. K. Anitha and N. Kandaraj are brought Fuzzy ideals and Fuzzy dot ideals on BH-algebras. In this paper, we outline Anti multi-fuzzy ideals in BH-algebra and talk a number of their associated primarily based on level subsets and homomorphism.

## 2. PRELIMINARIES:

In this phase we talk the fundamental definitions of a BH-algebras.

**Definition 2.1:[1,2,3]** Let  $X$  be a nonempty set with a binary operation  $*$  and a constant  $0$ . Then  $(X, *, 0)$  is referred to as a BCI-algebras if it satisfies the subsequent conditions.

1.  $((x * y) * (x * z)) * (z * y) = 0$
2.  $(x * (x * y)) * y = 0$
3.  $x * x = 0$
4.  $x * y = 0$  and  $y * x = 0 \Rightarrow x = y \forall x, y \in X$ .

**Example 2.2:** Let  $X = \{0, a, b, c\}$  be a set with the subsequent cayley table.

*	0	a	b	C
0	0	0	0	0
a	a	0	a	0
b	b	b	0	0
c	c	c	c	0

Then  $(X, *, 0)$  is known as a BCI-algebras.

**Definition 2.3:[1,2,3]** Let  $X$  be a nonempty set with a binary operation  $*$  and a constant  $0$ . Then  $(X, *, 0)$  is known as a BCK-algebras if it satisfies the subsequent conditions.

1.  $((x * y) * (x * z)) * (z * y) = 0$
2.  $(x * (x * y)) * y = 0$
3.  $x * x = 0$
4. If  $x * y = 0$  and  $y * x = 0 \Rightarrow x = y$
5.  $0 * x = 0$  for all  $x, y, z \in X$ .

**Example 2.4:** Let  $X = \{0,1,2,3\}$  be a set with the subsequent cayley table.

*	0	1	2	3
0	0	0	0	0
1	1	0	1	2
2	2	3	0	0
3	3	1	2	0

Then  $(X, *, 0)$  is known as a BCK-algebras.

**Definition 2.5:[7,8]** Let  $X$  be a nonempty set with a binary operation  $*$  and a constant  $0$ . Then  $(X, *, 0)$  is referred to as a BH-algebras if it satisfies the following conditions.

1.  $x * x = 0$
2.  $x * 0 = x$
3. If  $x * y = 0$  and  $y * x = 0 \Rightarrow x = y$   $x, y \in X$ .

**Example 2.6:** Let  $X = \{0,1,2,3\}$  be a set with the subsequent cayley table.

*	0	1	2	3
0	0	1	2	3
1	1	0	2	1
2	2	3	0	0
3	3	2	3	0

Then  $(X, *, 0)$  is known as a BH-algebras.

**Definition 2.7:[8]**

Let  $S$  be a nonempty subset of a BH-algebra  $X$ , then  $S$  is referred to as subalgebra of BH-algebra if  $x * y \in S$  for all  $x, y \in S$ .

**Definition 2.8:[8]**

Let  $X$  be a BH-algebra and  $I$  be a subset of  $X$ , then  $I$  is known as a ideal of  $X$  if Satisfies the following conditions.

1.  $0 \in I$
2.  $x * y \in I$  and  $y \in I \Rightarrow x \in I$  for all  $x, y \in I$
3.  $x \in I$  and  $y \in X \Rightarrow x * y \in I$

**Definition 2.9:[9]**

Let  $\sigma$  be a fuzzy set in a BH-algebra  $X$ . Then  $\sigma$  is referred to as a fuzzy BH-subalgebra if  $\sigma(x * y) \geq \min\{\sigma(x), \sigma(y)\} \forall x, y \in X$

**Definition 2.10:[7,8,10]**

Let  $\sigma$  be a fuzzy set in a BH-algebra  $X$ . Then  $\sigma$  is referred to as a fuzzy BH-ideal if it satisfies the subsequent conditions.

1.  $\sigma(0) \geq \sigma(x)$
2.  $\sigma(x) \geq \min\{\sigma(x * y), \sigma(y)\}$
3.  $\sigma(x * y) \geq \min\{\sigma(x), \sigma(y)\} \forall x, y \in X$ .

**Definition 2.11[7,8]** A mapping  $g: X \rightarrow Y$  of a BH-algebra is referred to as a homomorphism if  $g(x * y) = g(x) * g(y) \forall x, y \in X$ .

**Definition 2.12[6]**

Let  $X$  be a nonempty set. Define a multi-fuzzy set  $B$  in  $X$  is a set of ordered sequences:

$$B = \{(x, \sigma_1, \sigma_2, \dots, \sigma_i, \dots): x \in X\}, \text{ where } \sigma_i: X \rightarrow [0,1] \text{ for all } i$$

**Remark 2.13[6]**

1. If the sequences of the membership functions have only  $k$ -terms (finite wide of terms)  $k$  is called the dimension of  $B$ .
2. The set of all multi-fuzzy sets in  $X$  of dimension  $k$  is denoted through  $M^k FS(X)$ .
3. The multi-fuzzy membership function  $\sigma_B(x)$  is a function from  $X$  to  $[0,1]^k$  such that for all  $x \in X$   $\sigma_B(x) = (\sigma_1(x), \sigma_2(x), \dots, \sigma_k(x))$
4. For the sake of simplicity, we denote the multi-fuzzy set as  $B = \{(x, \sigma_1(x), \sigma_2(x), \dots, \sigma_k(x), \dots): x \in X\}$  as  $B = (\sigma_1, \sigma_2, \dots, \sigma_k)$ .

**Definition 2.14[6]**

Let  $k$  be a positive integer and allow  $B$  and  $C$  in  $M^k FS(X)$ , where  $B = (\sigma_1, \sigma_2, \dots, \sigma_k)$  and  $C = (\rho_1, \rho_2, \dots, \rho_k)$  then we have got the subsequent members of the relations and operations:

1.  $B \subseteq C$  if and only if  $\sigma_i \leq \rho_k$ , for all  $i = 1, 2, \dots, k$
2.  $B = C$  if and only if  $\sigma_i = \rho_k$ , for all  $i = 1, 2, \dots, k$
3.  $B \cup C = (\sigma_1 \cup \rho_1, \dots, \sigma_k \cup \rho_k) = \{(x, \max(\sigma_1(x), \rho_1(x)), \dots, \max(\sigma_k(x), \rho_k(x))): x \in X\}$
4.  $B \cap C = (\sigma_1 \cap \rho_1, \dots, \sigma_k \cap \rho_k) = \{(x, \min(\sigma_1(x), \rho_1(x)), \dots, \min(\sigma_k(x), \rho_k(x))): x \in X\}$ .

**Definition 2.15[6]**

Let  $B$  be a multi-fuzzy set in BH-algebra  $X$ . For any  $s = (s_1, s_2, \dots, s_k)$  where  $s_i \in [0,1]$  for all  $i$ , the set  $\cup(B; s) = \{x \in X/B(x) \geq s\}$  is referred to as the multi-level subset of  $B$ .

**Definition 2.16[6]**

Let  $B$  be a multi-fuzzy set in BH-algebra  $X$ . Then  $B$  is referred to as Anti multi-fuzzy closed ideal in  $X$  if it satisfies the subsequent conditions

1.  $B(x) \leq \max\{B(x * y), B(y)\}$
2.  $B(0 * x) \leq B(x)$

**Example 2.17:** Let  $X = \{0,1,2,3\}$  be a set with the subsequent cayley table.

*	0	1	2	3
0	0	1	2	3
1	1	0	1	1
2	2	2	0	2
3	3	2	2	0

Then  $B$  is known as Anti multi-fuzzy closed ideal in  $X$ .

**Definition 2.18[6]**

Let  $\sigma$  be a fuzzy set in a BH-algebra  $X$ . Then  $\sigma$  is referred to as Anti fuzzy BH-ideal if it satisfies the subsequent conditions.

1.  $\sigma(0) \leq \sigma(x)$
2.  $\sigma(x) \leq \max\{\sigma(x * y), \sigma(y)\}$
3.  $\sigma(x * y) \leq \max\{\sigma(x), \sigma(y)\} \forall x, y \in X$

**3.ANTI MULTI-FUZZY BH-IDEAL IN BH-ALGEBRAS :**

In this segment we mentioned the Anti multi-fuzzy BH-ideal and its properties.

**Definition 3.1[6]**

Let  $B$  be a multi-fuzzy set in BH-algebra  $X$ . Then  $B$  is known as a multi-fuzzy BH-ideal in  $X$  if it satisfies the subsequent conditions.

1.  $B(0) \leq B(x)$
2.  $B(x) \leq \max\{B(x * y), B(y)\}$
3.  $B(x * y) \leq \max\{B(x), B(y)\} \forall x, y \in X$

**Example 3.2:** Let  $X = \{0,1,2\}$  be a set with the subsequent cayley table.

*	0	1	2
0	0	1	2
1	1	0	1
2	2	2	0

Define a multi-fuzzy set  $B: X \rightarrow [0,1]$  with the aid of using  $B(0)=B(1)=(p_1, p_2)$  and  $B(2)=(q_1, q_2)$  where  $p_1, p_2, q_1, q_2 \in [0,1]$  with  $p_1 > q_1$  and  $p_2 > q_2$ . Then  $B$  is Anti multi-fuzzy BH-ideal in BH-Algebras.

**Theorem 3.3**

Let  $X$  be a BH-algebra. Then  $B$  is Anti muti-fuzzy BH-ideal in  $X$  if and only if  $B$  is a Anti multi-fuzzy subalgebra of  $X$ .

Proof:

Let  $X$  be a BH-algebra.

Let  $B$  be Anti multi-fuzzy BH-ideal in BH-algebra  $X$ .

To show that  $B$  is Anti multi-fuzzy subalgebra in BH-algebra  $X$

We recognize that Every Anti multi fuzzy BH-ideal of a BH-algebra  $X$  is a Anti multi- fuzzy subalgebra of  $X$ .

Let  $B$  be Anti multi fuzzy subalgebra in  $X$ .

To show that  $B$  is Anti muti fuzzy BH-ideal in  $X$ .

Let  $x, y \in X$

By the use definition of BH-algebras conditions.

- 1)  $B(0) = B(x * x)$   
 $\leq \max\{B(x), B(x)\}$   
 $B(x) \forall x \in X$
- 2)  $B(x) = B((x * y) * (0 * y))$   
 $\leq \max\{B(x * y), B(0 * y)\}$   
 $\leq \max\{B(x * y), \max\{B(0), B(y)\}\}$   
 $\leq \max\{B(x * y), B(y)\}$
- 3) It is in reality true.

Hence B is a Anti multi fuzzy BH- ideal in X.

**Theorem 3.4:**

Let  $B_1$  and  $B_2$  be two Anti multi fuzzy BH-ideals of a BH-algebra X. Then  $B_1 \cup B_2$  is a Anti multi-fuzzy BH-ideal of X.

Proof:

Let  $B_1$  and  $B_2$  be two Anti multi fuzzy BH-ideals of a BH-algebra X.

To show that  $B_1 \cup B_2$  is a Anti multi-fuzzy BH-ideal of X.

Let  $x, y \in B_1 \cup B_2$ .

Then  $x, y \in B_1$  and  $x, y \in B_2$

By the usage of multi fuzzy set union definition conditions

1.  $B_1 \cup B_2(0) = (x * x)$   
 $B_1 \cup B_2 = \max\{B_1(x * x), B_2(x * x)\}$   
 $\leq \max\{\max\{B_1(x), B_1(x)\}, \max\{B_1(x), B_2(x)\}\}$   
 $= \max\{B_1(x), B_2(x)\}$   
 $= B_1 \cup B_2(x)$
2.  $B_1 \cup B_2(x) = \max\{B_1(x), B_2(x)\}$   
 $\leq \max\{B_1(x * y), B_2(y)\}, \max\{B_2(x * y), B_2(y)\}$   
 $= \max\{B_1(x * y), B_2(x * y)\}, \max\{B_1(y), B_2(y)\}$   
 $= B_1 \cup B_2(x * y), B_1 \cup B_2(x)(y)$
3.  $B_1 \cup B_2(x * y) = \max\{B_1(x * y), B_2(x * y)\}$   
 $\leq \max\{\max\{B_1(x), B_2(y)\}, \max\{B_1(x), B_2(y)\}\}$   
 $= \max\{\max\{B_1(x), B_2(x)\}, \max\{B_1(y), B_2(y)\}\}$   
 $= \max\{B_1 \cup B_2(x), B_1 \cup B_2(y)\}$

Hence the proof.

**Definition 3.5:**

Let B be a multi fuzzy set in a BH-algebra X. Then B is referred to as Anti multi fuzzy closed ideal in X if it satisfies the subsequent conditions:

1.  $B(x) \leq \max\{B(x * y), B(y)\}$
2.  $B(0 * y) \leq B(x)$

**Example 3.6:** Let  $X = \{0,1,2,3\}$  be a set with the subsequent cayley table.

*	0	1	2	3
0	0	1	2	3

1	1	0	1	1
2	2	2	0	2
3	3	3	3	0

Let  $B: X \rightarrow I$  be a multi-fuzzy set described with the aid of using  $B(0) = B(1) = (0.6, 0.8)$  and  $B(2) = B(3) = (0.3, 0.4)$ .

Then  $B$  is known as multi-fuzzy closed ideal in  $X$ .

**Theorem 3.7:** Every Anti multi-fuzzy closed ideal is a Anti multi fuzzy ideal in  $X$ .

Proof: Let  $B$  be a Anti multi fuzzy closed ideal in  $X$ .

To show that  $B$  is a Anti multi fuzzy ideal in  $X$

It is sufficient to show that  $B(0) \leq B(x)$

Now,  $B(0) \leq \max\{B(0 * x), B(x)\}$

Since through the use of Anti multi fuzzy closed ideal conditions

$$B(0) \leq \max\{B(x), B(x)\} \\ = B(x)$$

Clearly ii and iii are true.

**Remark 3.8**

The speak of the above theorem is not always true.

**Theorem 3.9**

If  $B$  is a Anti multi fuzzy BH-ideal in  $X$ , then the set  $\cup (B; s)$  is a BH-ideal in  $X$  for  $s = s_1, s_2, \dots, s_k$  where  $s_i \in [0, 1]$ , for all  $i$ .

Proof:

Let  $B$  be a Anti multi fuzzy BH-ideal in  $X$ .

To show that  $\cup (B; s)$  is a BH-ideal in  $X$

- i) Since  $B(0) \leq B(x) \leq s$
- ii) Let  $x * y \in U(B; s)$  and  $y \in U(B, s)$   
Then  $B(x * y) \leq s$  and  $B(y) \leq s$   
Now  $B(x) \leq \max\{B(x * y), B(y)\}$   
 $\leq \max\{s, s\} = s$

This implies that  $x \in U(B; s)$

- iii) Let  $x \in U(B; s)$  and  $y \in X$   
Choose  $y \in X$  such that  $B(y) \leq s$   
 $B(x * y) \leq \max\{B(x), B(y)\}$   
 $\leq \max\{s, s\} = s$

This implies that  $x * y \in U(B; s)$

Hence  $U(B; s)$  is a BH-ideal in  $X$ .

#### 4. HOMOMORPHISM OF ANTI MULTI-FUZZY BH-IDEALS :

In this segment we mentioned approximately the properties of Anti multi fuzzy BH-ideals under homomorphism.

**Definition 4.1**

Let  $g: X \rightarrow Y$  be a mapping of BH-algebra and  $B$  be a Anti multi fuzzy set  $Y$  then  $g^{-1}(B)$  is the pre-image of  $B$  under  $g$  if  $g^{-1}(x) = B(g(x)) \forall x \in X$ .

**Theorem 4.2**

Let  $g: X \rightarrow Y$  be a homomorphism of BH-algebra. If  $B$  is Anti multi fuzzy BH-ideal of  $Y$ . Then  $g^{-1}(B)$  is a Anti multi fuzzy BH-ideal of  $X$ .

Proof:

Let  $g: X \rightarrow Y$  be a homomorphism of BH-algebra.

Let  $B$  is a Anti multi fuzzy BH-ideal of  $Y$ .

To show that  $g^{-1}(B)$  is a Anti multi fuzzy BH-ideal of  $X$ .

For any  $x \in X$ ,

By the usage of Anti multi fuzzy BH-ideal.

$$\begin{aligned}
1) g^{-1}(B)(x) &= B(g(x)) \leq B(0) \\
&= B(g(0)) \\
&= g^{-1}(B)(0) \\
2) g^{-1}(B)(x) &= B(g(x)) \leq \max\{B(g(x)) * B(g(y)), B(g(y))\} \\
&= \max\{B(g(x * y)), B(g(y))\} \\
&= \max\{g^{-1}(B)(x * y), g^{-1}(B)(y)\} \\
3) g^{-1}(B)(x * y) &= B(g(x * y)) = B(g(x) * g(y)) \\
&\leq \max\{B(g(x)), B(g(y))\} \\
&= \max\{g^{-1}(B)(x), g^{-1}(B)(y)\}
\end{aligned}$$

Hence  $g^{-1}(B)$  is a Anti multi fuzzy BH-ideal of  $X$ .

**Theorem 4.3**

Let  $g: X \rightarrow Y$  be an epimorphism of a BH-algebra. If  $g^{-1}(B)$  is a Anti multi fuzzy ideal in  $X$  then  $B$  is a Anti multi fuzzy ideal in  $Y$ .

Proof:

Let  $g: X \rightarrow Y$  be an epimorphism of a BH-algebra

Let  $g^{-1}(B)$  is a Anti multi fuzzy ideal in  $X$

To show that  $B$  is a Anti multi fuzzy ideal in  $Y$ .

Let  $y \in Y$  there exists  $x \in X$  such that  $g(x) = y$

$$\begin{aligned}
&= B(g(x)) = g^{-1}(B)(x) \\
&\leq g^{-1}(B)(0) \\
&= B(g(0)) = B(0)
\end{aligned}$$

That is  $B(0) \geq B(y)$

ii) Let  $x, y \in Y$  there exists  $a, b \in X$  such that  $g(a) = x, g(b) = y$

$$\begin{aligned}
B(x) &= B(g(a)) \\
&= g^{-1}(B)(a) \\
&\leq \max\{g^{-1}(B)(a * b), g^{-1}(B)(b)\} \\
&= \max\{B(g(a * b)), B(g(b))\} \\
&= \max\{B(g(a) * g(b)), B(g(b))\} \\
&= \max\{B(x * y), B(y)\}
\end{aligned}$$

iii)  $B(x * y) = B(g(a) * g(b))$

$$\begin{aligned}
&= B(g(a * b)) \\
&= g^{-1}(B)(a * b)
\end{aligned}$$

$$\begin{aligned} &\leq \max\{g^{-1}(B)(a), g^{-1}(B)(b)\} \\ &= \max\{B(g(a)), B(g(b))\} \\ &= \max\{B(x), B(y)\} \end{aligned}$$

Hence B is Anti multi-fuzzy BH-ideal in Y.

**ABSTRACT :** *This paper introduces a new type of generalised  $\omega$ -open sets, as well as some generalised locally closed sets in topological spaces, in order to derive a decomposition of  $\omega$ -continuity.*

**Key words:**  $\beta - g\omega$  -open set, locally closed set,  $\beta - g\omega$  - locally closed set, locally  $\omega - \beta$ -closed set.

## 1. INTRODUCTION:

An updated version of generalised closed sets was first presented by Levine [5] in the field of topology. In a topological space, Andrijevic [4] defined a category of generalised open sets called b-open sets. Gama-open sets are a subclass of sets that were studied by Ekici and Caldas [8]. In his 1980 paper, Dunham examined the topological findings of generalised closed sets. Many inquiries about b-open sets were explored by Ganster [7]. Since the inception of these ideas, several studies have been documented, each with its own unique set of findings.

This paper presents a new category of semi-generalized b-closed sets, semi-generalized b-open sets, Tsgb-space and investigates their connections to related classes. The differences between open sets and closed sets, as well as their qualities, have been explored. In addition, a new operator, the lorry operator, has been added, and some of its attributes have been investigated in this chapter.

## 2. SEMI GENERALIZED b-CLOSED SET :

Here, the definition of semi-generalized b-closed set and certain characterizations are discussed.

**Definition 2.1:** If  $bCl(A) \subseteq G$ , then subset  $A$  of  $(X, \tau)$  is consider to be a semi generalized b - closed set represented by sgb - closed set whenever  $G$  and  $A \subseteq G$  is semi open in  $(X, \tau)$ .

**Definition 2.2:** The notation  $sgbc(X)$  stands for the set of all sgb - closed sets in the topological space  $(X, \tau)$ .

**Theorem 2.3:** Suppose  $(X, \tau)$  contains  $A$  be a sgb – closed subset ,that means non-empty closed sets does not contain in  $bCl(A) - A$ .

**Proof:** Suppose  $F \in Cl(X)$  such that  $F \subseteq bCl(A) - A$  where  $X - F$  is semi open.

$A \subseteq X - F$  and  $A$  will be sgb – closed.

Its follows that  $bCl(A) \subseteq X - F$

Hence  $F \subseteq X - bCl(A)$ .

Which infers that  $F \subseteq (X - bCl(A)) \cap (bCl(A) - A) = \varphi$ .

Therefore  $F = \varphi$ .

**Corollary 2.4:** Suppose  $A$  be consider as sgb – closed set. Therefore iff  $bCl(A) - A$  is closed set then  $A$  is said to be b – closed.

**Proof: Necessary part:** Suppose  $A$  be a sgb – closed set.  $bCl(A) - A = \varphi$  which is closed set when  $A$  is b-closed.

**Converse part:** Consider  $bCl(A) - A$  be closed, here with theorem 4.2.3  $bCl(A) - A$  will not have any non-empty closed subset and as  $bCl(A) - A$  will be closed subset of itself.

Then,

$$bCl(A) - A = \varphi$$

$$bCl(A) = A$$

and  $A$  is b – closed set.

**Theorem 2.5:** Suppose  $B \subseteq A \subseteq X$  in which  $A$  is a semi-open set and sgb-closed set.  $B$  is then sgb-closed relation to  $A$  iff  $B$  is sgb – closed in  $X$ .

**Proof: Necessary part:** It is first considered that as  $B \subseteq A$  and  $A$  are both sgb-closed and semi open set,  $bCl(A) \subseteq A$  and thus  $bCl(B) \subseteq bCl(A) \subseteq A$

Hence,  $A \cap bCl(B) = bCl_A(B)$

$$bCl(B) = bCl_A(B) \subseteq A$$

Given that  $B$  is sgb – closed with respect to  $A$  and  $G$  will be a semi-open subset of  $X$ ,

$B \subseteq G$ , therefore

$$B = B \cap A \subseteq G \subseteq A$$

In which  $G \cap A$  is semi open in  $A$ .

That means,  $B$  is sgb – closed relative to  $A$ ,

$$bCl(B) = bCl_A(B) \subseteq G \cap A \Rightarrow bCl(B) \subseteq G$$

Therefore  $B$  is sgb – closed in  $X$ .

**Converse part:** Suppose  $B \subseteq G$ , then  $G = V \cap A$  for certain semi open subset  $V$  of  $X$ .

As  $B \subseteq V$  and  $B$  is sgb – closed in  $X$ ,

$bCl(B) \subseteq V$ ,

Hence  $bCl_A(B) = bCl(B) \cap A \subseteq V \cap A \subseteq G \Rightarrow bCl_A(B) \subseteq G$

Therefore  $B$  is sgb – closed in relation to  $A$ .

**Remark 2.6:** Suppose subset  $A$  be semi open and sgb-closed,  $A \cap F$  is then sgb-closed whenever  $F \in bCl(X)$ .

**Proof:** The set  $A$  will be b-closed since  $bCl(A) \subseteq A$  and  $A$  is sgb-closed and semi-open. As a result,  $A \cap F$  is b-closed in  $X$  that indicates that  $A \cap F$  is sgb-closed in  $X$ .

Hence  $A$  is semi open set and represented as –closed , thereore  $bCl(A) \subseteq A$  and that means

A is b – closed. Therefore,  $A \cap F$  is b-closed in X that infers that  $A \cap F$  will be sgb-closed in X.

**Theorem 2.7:** When A is a sgb-closed set and B is any set so that  $A \subseteq B \subseteq \text{bCl}(A)$ , B is then a sgb – closed set.

**Proof:** Suppose  $B \subseteq G$  where G is semi open set. As A is sgb-closed set and  $A \subseteq G$  therefore  $\text{bCl}(A) \subseteq G$  and also  $\text{bCl}(A) = \text{bCl}(B)$ .

That means,  $\text{bCl}(B) \subseteq G$  and thus B is sgb – closed set.

**Theorem 2.8:** Any pair of sets that intersect is also a sgb – closed set.

**Proof:** Suppose A and B be two sgb – closed set, that is,  $\text{bCl}(A) \subseteq G$  whenever  $A \subseteq G$  and G is semi open &  $\text{bCl}(B) \subseteq G$  wherever  $B \subseteq G$  and G is semi open.

Now,  $\text{bCl}(A \cap B) = \text{bCl}(A) \cap \text{bCl}(B) \subseteq G$

Here  $A \cap B \subseteq G$  and G is semi-open. Hence, any two sgb – closed sets may intersect inside themselves.

**Remark 2.9:** As given in the subsequent example, union of any two sgb – closed sets is not required to be a sgb – closed set.

**Example 2.10:** Suppose  $X = \{a, b, c\}, \tau = \{X, \varphi, \{a, b\}\}$  in this topology space  $(X, \tau)$ , Therefore, the union of a and b does not constitute a sgb-closed set, despite the fact that the subsets a and b themselves do.

**Theorem 2.11:** Each b – closed set is sgb – closed set.

**Proof:** Let us assume that X includes two sets, A, which is a b-closed set, and G, which is a semi-open set that contains A. Therefore, each b – closed set is sgb – closed set.

Here  $G \supseteq A = \text{bCl}(A)$

**Remark 2.12:** As given in the subsequent example, the reverse of the above theorem does not necessarily have to be correct.

**Example 2.13:** Suppose  $X = \{a, b, c\}, \tau = \{X, \varphi, \{a\}, \{c\}, \{a, c\}\}$ , this topological space  $(X, \tau)$ , the subset  $\{a, c\}$  will be sgb-closed which will not be b-closed set.

**Theorem 2.14:** Each swg – closed set is sgb – closed set.

**Proof:** Suppose A be a swg – closed set.

That means  $\text{Cl}(\text{Int } A) \subseteq G$  in this equation.

$A \subseteq G$  & G are semi-open.

Due to the fact that all semi-closed sets are b-closed sets,  $\text{bCl } A \subseteq \text{Cl}(\text{Int } A) \subseteq G$  and G is semi-open.

That means A is sgb – closed set.

**Remark 2.15:** As given in the subsequent example, the reverse of the above theorem does not necessarily have to be correct.

**Example 2.16:** Suppose  $X = \{a, b, c\}, \tau = \{X, \varphi, \{b\}, \{c\}, \{b, c\}\}$ . Subset  $\{b\}$  is a sgb – closed set, which is not a swg – closed set, in this topological space  $(X, \tau)$ .

**Theorem 2.17:** Each  $\alpha$  – closed set is sgb-closed set.

**Proof:** Suppose A be a  $\alpha$  – closed set therefore,  $\alpha \text{Cl } A \subseteq G$  whenever  $A \subseteq G$  and G is  $\alpha$  – open. Hence, each  $\alpha$  – closed sets are b-closed sets,

$\text{bCl}(A) \subseteq \alpha \text{Cl } A \subseteq G$  and G is semi – open. Therefore A is sgb – closed.

Hence, each  $\alpha$  – closed set is sgb-closed set.

### 3. SEMI GENERALIZED b-OPEN SETS :

This section describes the characteristics of the newly discovered class of semi-generalized b-open set in topological spaces that has been introduced here.

**Definition 3.1:** When the complement  $A^c$  of a subset  $A$  of  $(X, \tau)$  is also a semi generalised b-open set, we say that  $A$  is semi generalised b-open.

The set  $\text{sgbO}(X)$  represents all sets in  $X$  that are sgb-open.

**Theorem 3.2:** A subset  $A \subseteq X$  will be sgb-closed set if  $F \subseteq b \text{ Int} (A)$  if  $F$  is closed set and  $F \subseteq A$ .

**Proof:** Suppose  $A$  be a sgb – open set & consider  $F \subseteq A$  here  $F$  is closed,  $X - A$  is that means a sgb – closed set in the semi open set  $X - F$ . Therefore,

$bCl (X - A) \subseteq X - F$  and  $X - b \text{ Int} (A) \subseteq X - F$ . Therefore  $F \subseteq b \text{ Int} (A)$ . Contrariwise, if  $F$  is a closed set with  $F \subseteq b \text{ Int} (A)$  and  $F \subseteq A$  therefore  $X - b \text{ Int} (A) \subseteq X - F$ , that means  $bCl (X - A) \subseteq X - F$ . Therefore,  $X - A$  is sgb – closed set and  $A$  is a sgb – closed set.

### 4. SEPERATION AXIOMS OF $T_{\text{sgb}}$ -SPACES

In this section, we investigate the axiom-splitting process and develop a new kind of topological space called  $T_{\text{sgb}}$ -space. The connection to related areas is also elaborated upon.

**Definition 4.1:**  $(X, \tau)$  is considered to be  $T_{\text{sgb}}$  – space with a condition that each sgb – closed set is semi-closed set.

**Theorem 4.2:** Each  $T_{\text{swg}}$  – space is  $T_{\text{sgb}}$  – space.

**Proof:** Suppose  $X$  be  $T_{\text{swg}}$  – space and  $A$  be a swg – closed set in  $X$  that means  $A$  is considered as sgb – closed set through Theorem 4.2.14. Due to the fact that  $X$  is a  $T_{\text{swg}}$  – space,  $A$  is closed, and as a result, it is semi-closed. As a result,  $X$  belongs to the  $T_{\text{sgb}}$  – space class.

**Remark 4.3:** As may be seen from the following example, the reverse of the above theorem does not necessarily have to be correct.

**Example 4.4:** Suppose  $X = \{a, b, c\}, \tau = \{X, \phi, \{a\}\}$ . In this topological space  $(X, \tau)$  is  $T_{\text{sgb}}$  – space and not  $T_{\text{swg}}$  -space, where the subset  $\{b\}$  is swg – closed which is not closed set.

**Remark 4.5:** Here are some illustrations that illustrate how independent the  $T_{\text{sgb}}$  – space and pre- $T_{1/2}$  – space are from one another.

**Example 4.6:** Suppose  $X = \{a, b, c\}, \tau = \{X, \phi, \{a\}\}$ . In this topological space  $(X, \tau)$  is  $T_{\text{sgb}}$  – space and not pre  $T_{1/2}$  -spaces, due to the fact that the subset  $\{a, b\}$  is a gp-closed set, rather than a pre-closed set.

**Example 4.7:** Suppose  $X = \{a, b, c\}, \tau = \{X, \phi, \{a, b\}\}$ . In this topological space  $(X, \tau)$  is pre  $T_{1/2}$  – space and not  $T_{\text{swg}}$  – spaces, since the subset  $\{a\}$  is sgb-closed set which is not semi-closed set.

**Remark 4.8:** The following examples demonstrate that the  $T_{\text{sgb}}$  – spaces and  $T_d$  – spaces are distinct from one another.

**Example 4.9:** Suppose  $X = \{a, b, c\}, \tau = \{X, \phi, \{a\}, \{a, b\}\}$ . In this topological space  $(X, \tau)$  is  $T_{\text{sgb}}$  – spaces and not  $T_d$  – spaces, since the subset  $\{b\}$  is gs – closed set that is not g-closed set.

**Example 4.10:** Suppose  $X = \{a, b, c\}, \tau = \{X, \varnothing, \{c\}, \{a, b\}\}$  this topological space  $(X, \tau)$  is  $T_d$  – space and not  $T_{sgb}$  – spaces, since the subset  $\{b\}$  is  $sgb$  – closed set which is not semi-closed set.

**Definition 4.11:** For any subset  $E$  of  $(X, \tau)$ , the following is defined,

$$bCl^*(E) = \bigcap A : E \subset A (\in bD(X, \tau))$$

Where  $bD(X, \tau) = \{A : A \subset X \text{ and } A \text{ is } sgb \text{ closed in } (X, \tau)\}$

**Theorem 4.12:** Suppose  $E$  and  $F$  be the two subsets of a space  $(X, \tau)$ . Then,

- (i)  $E \subset bcl^*(E) \subset bcl(E) \subset cl(E)$
- (ii)  $bcl^*(\varnothing) = \varnothing$  and  $bcl^*(X) = X$
- (iii)  $bcl^*(E \cup F) \supset bcl^*(E) \cup bcl^*(F)$
- (iv)  $bcl^*(bcl^*E) = bcl^*(E)$  and
- (v) if  $E$  is  $sgb$  – closed then  $bcl^*(E) = E$ .

The argument may be shown to be self-evident once the definitions and characteristics of  $sgb$  – closed sets are understood.

**Theorem 4.13:** For every  $x \in X, \{x\}$  will be semi-closed or its compliment  $\{x\}^{c}$  will be  $sgb$ -closed in a space  $(X, \tau)$ .

**Proof:** Consider  $\{x\}$  is not semi-closed in  $(X, \tau)$ . As  $\{x\}^{c}$  will not be semi-open. The space  $X$  itself is only semi-open set containing  $\{x\}^{c}$ . Therefore,  $bCl(\{x\}^{c})$  holds and  $\{x\}^{c}$  is  $sgb$ -closed.

**Theorem 4.14:** For a space  $(X, \tau)$  if  $x \neq y$  then  $bcl^*(x) \neq bcl^*(y)$ .

**Proof:** With the help of above Theorem, it is sufficient to prove the following, that is

$\{x\}^{c}$  is  $sgb$  – closed. Since  $\{y\} \subset \{x\}^{c}, y \in bcl^*(\{y\}) \subset \{x\}^{c},$   
 $bcl^*(\{y\}) \neq bcl^*(\{x\})$ .

**Definition 4.15:**  $S.O (X, \tau)^* = \{B : bcl^*(B^c) = (B^c)\}$

**Remarks 4.16:** If  $E \in bD(X, \tau)$  (Def. 4.5.1) then  $E^c \in S.O(X, \tau)^*$

**Theorem 4.17:** (i)  $S.O.(\tau) \subset S.O.(\tau)^*$  holds

(ii) A space  $(X, \tau)$  is  $T_{sgb}$  if and only if  $S.O.(\tau) \in S.O.(\tau)^*$  holds.

**Proof:** (i) Suppose  $E \in S.O.(\tau)$ , its complement  $E^c$  then is semi-closed, if and only if  $E^c = bCl(E^c)$ , which follows from Theorem 4.5.2 (i) that  $bcl^*(E^c) = E^c$  holds.

That is  $E \in S.O.(\tau)^*$ .

(ii) **Necessity:** Given that the assumption is true, the semi-closed sets and the  $sgb$  – closed sets are equivalent,  $bCl(E) = bcl^*(E)$  holds for every subset of  $(X, \tau)$ .

Hence  $S.O.(\tau) \in S.O.(\tau)^*$

**Sufficiency:** Suppose  $A$  be as  $sgb$  – closed set of  $(X, \tau)$ .

With the help of Theorem 4.5.2(V), then  $A = bcl^*(A)$  and hence  $A^c \in S.O.(\tau)$

Hence  $A$  is semi-closed. That means  $(X, \tau)$  is  $T_{sgb}$  – space.
